# **Systems**

# IBM Virtual Machine Facility/370: Data Areas and Control Block Logic

Release 3 PLC 1

This publication, along with the *IBM Virtual Machine Facility/370: System Logic and Problem Determination Guide*, is intended for system programmers responsible for updating VM/370. This publication contains descriptions of the major data areas and control blocks used by three of the components of VM/370: the Control Program (CP), the Conversational Monitor System (CMS), and the Remote Spooling Communications Subsystem (RSCS).

#### **Prerequisite Publications**

To use this publication effectively and to understand it thoroughly, the following publications are prerequisite:

IBM System/370: Principles of Operation, Order No. GA22-7000 IBM OS/VS, DOS/VS, and VM/370 Assembler Language, Order No. GC33-4010.

#### <u>First Edition</u> (February 1976)

This edition corresponds to <u>Release 3</u> <u>PLC 1</u> (Program Level Change) of the IBH Virtual Machine Facility/370, and to all subsequent releases unless otherwise indicated in new editions or Technicals Newsletters (TNLs).

Changes are periodically made to the specifications herein; before using this publication in connection with the operation of IBM systems, consult the latest IBM System/370 Bibliography, Order No. GC20-0001, for the editions that are applicable and current.

Requests for copies of IBM publications should be made to your IBM representative or to the IBM branch office serving your locality.

A form for readers' comments is provided at the back of this publication. If the form has been removed, comments may be addressed to IBM Corporation, VM/370 Publications, 24 New England Executive Park, Burlington, Massachusetts 01803. Comments become the property of IBM.

This publication contains reference information about control blocks and data areas associated with three major components of VM/370: CP, CMS, and RSCS.

This publication contains three sections and five appendixes:

- "Section 1. CP Data Areas and Control Blocks" contains information about CP data areas and control blocks.
- "Section 2. CMS Data Areas and Control blocks" contains information on CMS data areas and control blocks.
- "Section 3. RSCS Data Areas and Control Blocks" contains information on RSCS data areas and control blocks.
- "Appendix A: CP and RSCS Equate Symbols" contains assembler language equate symbols used by CP and RSCS to reference data.
- "Appendix B: RSCS Control Areas" contains RSCS control areas, which define constants and variables used during execution.
- "Appendix C: RSCS Request Elements" contains RSCS request elements, which are tables used by RSCS for task-to-task communication.
- "Appendix D: CMS Equate Symbols" contains CMS equate symbols.
- "Appendix E: Data Areas and Control Block References" contains information on modules that reference data areas and control blocks.

#### OTHER VM/370 DATA AREAS AND CONTROL BLOCKS

Some data areas and control blocks relating to VM/370 service and support programs are not included in this publication. Information on these data areas and control blocks can be found in the IBM Virtual Machine Facility/370: Service Routines Program Logic manual, Order No. SY20-0882.

#### RELATED PUBLICATIONS

This publication is intended to be used in conjunction with IBM Virtual Machine Facility/370: System Logic and Problem Determination Guide, Order No. SY20-0885. Users of the publication IBM Virtual Machine Facility/370: System Programmer's Guide, Order No. GC20-1807 will also find this publication useful.

For a glossary of VM/370 terms, see the IBM Virtual Machine Facility/370: Glossary and Master Index, Order No. GC20-1813.

The hardware and software support personnel or installation system programmer should use the <u>IBM Virtual Machine Facility/370</u>: <u>Interactive Problem Control System (IPCS) User's Guide</u>, Order No. GC20-1823, for information on how to use the facilities of IPCS.

#### HOW TO USE THIS PUBLICATION

The CMS and RSCS components function under control of CP. Each component creates, updates, and erases its own control blocks and data areas.

Control blocks and data areas are generally blocks of related information applicable to one or more system functions. They are usually defined by the DSECT instruction. The blocks can reflect current status, history information, or combinations of both, applicable to VM/370 functions. Control blocks and data areas provide the linkage and information for the user, the hardware, and the programs to work as one entity for the successful execution of a job, task, or process.

This publication addresses and describes the major control blocks associated with CP, CMS, and RSCS. Generally, data areas, or scratch areas that are created and exist only during the execution of a particular module are not described in this publication. In this publication, the data areas and control blocks are arranged in alphabetical order by DSECT name.

For every data area or control block, a statement is given that defines the use of the data area or control block. This statement is followed by a formatted block showing the fields defined in the data area

or control block and the displacement into the DSECT of that field.

The formatted blocks for CP and CMS control areas are 8 bytes wide, showing two fullwords per line. RSCS control blocks are 4 bytes wide.

In the case where the name of a field is too large to fit into the formatted line, a pointer to the definition of the field is used instead of the name of the field. This pointer usually takes the form A\*1, A\*2, etc. When there is a particularly

large field (one that uses more than three or four lines of the formatted block), ellipses are used in the block to show that the displacement of this field is larger than can be shown in the block.

The formatted block is followed by listing-related information: the hexadecimal displacement of the field into the DSECT, the name of the field and its definition in the listing, and a brief description of the contents and meaning of the field.

This section contains descriptions of the major 1 shows the relationships of control blocks to each CP data areas each other. and control blocks. Figure

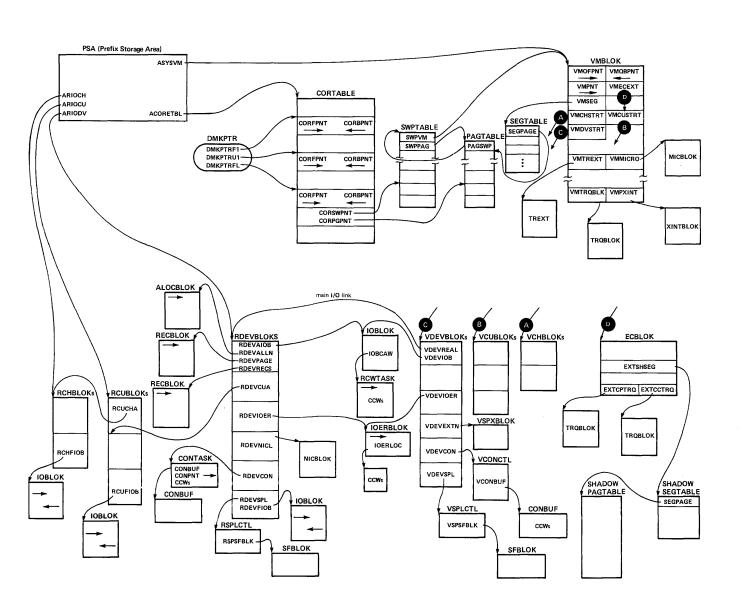

Figure 1. CP Control Block Relationships

#### ACCTBLOK: USER ACCOUNTING BLOCK

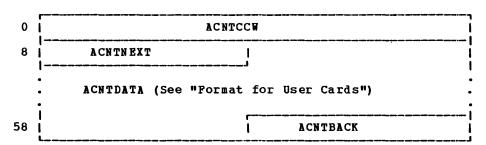

ACCTBLOK provides header information for spool files. The VMACOUNT field (hex 168) in the VMBLOK points to ACCTBLOK.

0		ACCTUSER	
8		ACCTACNO	
10		ACCTDIST	

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
	<del></del>		
0	ACCTUSER DS	CL8	Virtual machine identification
8	ACCTACNO DS	CL8	Virtual machine accounting number
10	ACCTDIST DS	CT8	Virtual machine distribution number
	ACCTLENG EOU	(*-ACCTBLOK) /8	Size of ACCTBLOK in doublewords (X'03')

#### ACNTBLCK: ACCOUNTING CARD BUFFER BLOCK

ACNTBLOK provides accounting and statistical information on each user that has used VM/370 facilities. The ARSPAC field (hex 39C) in the Prefix Storage Area (PSA) points to the start of the chain of ACNTBLOKs.

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	ACNTCCW DS	D	Punch CCW for accounting card
8	ACNTNEXT DS	F	Address of next ACNTBLOK in chain
С	ACNTDATA DS	CL80	Accounting information (see "Format For User Cards")
5C	ACNTBACK DS	F	Address of previous ACNTBLOK in chain
	ACNTSIZE ROU	(*-ACNTBLOK) /8	Size of ACNTBLOK in doublewords (X'OC')

# Format for User Cards

The fields below represent the 80 bytes defined by ACNTDATA in the preceding ACNTBLOK data area.

	Card Code	s for	ACNTCODE	
		DC	CICOI	User-formatted accounting card
		DC	C'x1'	User virtual machine accounting card
		DC	C'x2'	User dedicated device accounting card
		DC	C'x3'	User temporary disk space accounting card
			where:	
				card is initiated via a DIAGNOSE Code X'4C'
			x = 0 if the	card is initiated via CP command processing.
		ORG	ACNTTIME	
2C	ACNTDEVC		XL4	Device code (CTFM). See DEVTYPE copy file
30	ANCTNCYL	DS	1 H	Number of cylinders of T-disk space

#### ALOCBLOK: DASD CYLINDER ALLOCATION BLOCK

ALOCBLOK provides information on temporary disk space available to a virtual machine. The RDEVALLN field (hex 28) in the RDEVBLOK points to the ALOCBLOK.

0	ALOCPNT	 I	ALOCUSED	 1	A LOC MAX	1
8		ALC	CMAP			1

Hexadecimal Displacement			Field Description, Contents, Meaning
	<del></del>		
0	ALOCPNT DS	1 F	Pointer to next ALOCBLOK on chain
4	ALOCUSED DS	1 H	Number of cylinders currently in use
6	ALOCMAX DS	1 H	Maximum number of cylinders available
8	ALOCMAP DS	0 F	Cylinder allocation bit map

Bits defined in ALOCMAP
0 = Cylinder is available
1 = Cylinder has been allocated

 $\underline{\text{Note}}$ : The size of the ALOCMAP is variable and depends on the number of cylinders on the device. Generally, the size of the ALOCBLOK is determined by the following formula:

ALOCSIZE(doublewords) = ((((ALOCMAX+7)/8)+7)/8)+1

#### where:

ALOCMAX for 2305-1 = 48 cylinders
for 2305-2 = 96 cylinders
for 2314 = 203 cylinders
for 3330-1 = 404 cylinders
for 3330-2 = 404 cylinders
for 3330-11 = 808 cylinders
for 3333-1 = 404 cylinders
for 3333-11 = 808 cylinders
for 3340-35 = 349 cylinders
for 3340-70 = 698 cylinders
for 3350 = 555 cylinders

Any bits in the map that represent cylinders not present on the device are set to 1.

# $\begin{array}{ccc} \textbf{For} & \textbf{Temporary} & \textbf{Disk Allocation} & \textbf{Blocks} \\ & \textbf{ORG} & \textbf{ALOCUSED} \end{array}$

```
ALOCCYL1 DS 1H First cylinder of T-disk area

ALOCCYL2 DS 1H Last cylinder of T-disk area

Bytes defined in ALOCMAP

X'00' = Cylinder is available

X'AA' = Cylinder has been allocated
```

<u>Note</u>: The size of the T-disk ALOCMAP is variable and depends on the number of cylinders in the range ALOCCYL1 to ALOCCYL2. Generally, the size of a given block is determined by the following formula:

ALOCSIZE(doublewords) = ((ALOCCYL2-ALOCCYL1+8)/8)+1

Bytes for cylinders that are not available are marked allocated.

#### BSCBLOK: BINARY SYNCHRONOUS COMMUNICATION CONTROL BLOCK

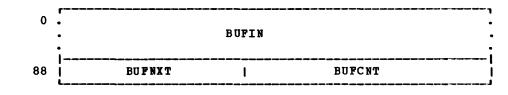

BSCBLOK provides status, control information buffers (necessary for polling and addressing), and channel programs for 3270 remote equipment. The RDEVBSC field (hex 30) in the RDEVBLOK points to the BSCBLOK.

0	BSCSCCW1

28	CCPRSTYP	DS	1 X		Resource type flag
29	CCPRSTAT		1 🗓		Resource initial status flags
21	CCPRSTEP		18		Subchannel address when in EP mode

#### CHXBLOK AND CHYBLOK: VIRTUAL CHANNEL-TO-CHANNEL ADAPTER CONTROL BLOCKS

CHXBLOK and CHYBLOK provide the necessary control for a virtual machine using a virtual channel-to-channel adapter (CTCA).

0	CHXOTHR	1	CHYOTHR
8	X*1   X*2   X*3   X*4	ı	Y*1   Y*2   Y*3   Y*4
10	CHXNCCW	ı	CHYNCCW
18	CHXRCNT	1	CHYRCNT
20	CHXSTAT   CHXYADD	1	CHYSTAT   CHXYADD
28	CHXIDAW	1	CHYIDAW
30	CHXCNCT	ľ	CHYCNCT
38	CHXDATN		CHYDATN

<u>Note:</u> As indicated in the illustrated block, the CHXBLOK and CHYBLOK are interleaved with a 4-byte displacement. The X-side YDEVBLOK points to the +0 slot, the Y-side VDEVBLCK points to the +4 slot; however, once the virtual connection is made, either side can be the X-side or the Y-side since this interleaved arrangement makes the control block references completely symmetrical. The dual DSECT definition allows the active adapter (defined to be the X-side, arbitrarily) to reference both adapter sides concurrently without knowing which is at +0 or at +4.

Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning

#### DDRREC: RECONFIGURATION MACRO

DDRREC is used in the SVC 76-initiated error recording process for type 60 DASD dump restore (DDR) dynamic device reallocation records. The reallocation records contain the replacement of the virtual "FROM" and "TO" control unit addresses (CUA) by the real addresses of the real DASD devices.

10	ERRCCNT	DS	2 X		Size of CONTASK data buffer
10	ERRCONT	DS	oc		CONTASK data buffer (variable length)

#### IOBLOK: I/O CONTROL BLOCK

IOBLOK contains information required to perform I/O operations. The I/O request initiator for the I/O operation is either a CP-initiated or virtual machine-initiated event.

#### IOERBLOK: I/O ERROR INFORMATION BLOCK

IOERBLOK contains information related to I/O and channel errors. This entails error retry, operator message information, and SDR (Statistical Data Recording) IOERBLOK related to I/O equipment.

Note: Additional sense bytes may be appended to ERRBLOK; their format is described in "IOBR3211: Extended Outboard Recording Block" in this section.

#### IRMBLOK: INTENSIVE ERROR RECORDING MODE BLOCK

IRMBLOK provides the information necessary for the implementation of intensive recording mode via CP SET RECORD command. Intensive recording mode allows the recording of unit check errors from a specified device whose SENSE data matches the values selected.

0	IRMFWPTR	IRMRLADD	IRMLMT
8		4   IRMLHTCT	I*5   I*6

Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning
0	IRMFWPTR	DS	1 F		Reserved for IBM use

## LOCKBLOK: USERID LOCK CONTROL BLOCK

LOCKBLOK is used to synchronize execution for sections of nonreenterable code. Locked users are returned to the CPEXBLOK queue when the function being executed completes or no longer requires nonreenterable resources.

0	LOCKNEXT	<u> </u>	TOCKÕNE	
8		LOCKNAME		

Hexadecimal Displacement			Field Description, Contents, Meaning
0	LOCKNEXT DS	1 F	Pointer to the next lock control block

8	LOCKNAME DS	1 D	The name being locked
	LOCKSIZE EQU	(*-LOCKBLOK)/8	LOCKBLOK size in doublewords (X 02)

## MCHAREA: MACHINE CHECK SAVE AREA

MCHAREA provides CP with statistical data that relates to malfunctions of the real CPU, to its buffers, to processor storage for damage assessment, and to the recovery of VM/370.

#### MICBLOK: VIRTUAL MACHINE POINTER LIST FOR VIRTUAL MACHINE ASSIST FEATURE

MICBLOK contains pointers to control registers, the segment table, and other values required by the virtual machine assist feature. This information is needed for the handling of certain instructions and privileged operations requested by the virtual machine.

0	MICRSEG		MICCREG	
8	MICVPSW	1	MICWORK	

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	MICRSEG	DS	1 <b>F</b>	Real segment table pointer
4	MICCREG	DS	1 F	Virtual control register pointer
8	MICVPSW	DS	1 F	Virtual PSW pointer
С	MICWORK	DS	1 F	Workspace pointer
	MICSIZE	EQU	(*-MICBLOK) /8	Size of DSECT in doublewords (X 02)
		ORG	MICVPSW	
8	MICVIP	DS	1 X	Virtual interrupt pending bit
	MICPEND	EQU	X • 80 •	Virtual interrupt is pending; therefore, the virtual machine assist feature is not to handle change of PSW channel masks or external mask from disabled to enabled. All other bits in this byte must be 0.
9		DS	3 <b>X</b>	Address of virtual PSW

# MIHREC: MISSING INTERRRUPT HANDLER ERROR RECORD

MIHREC block is used in the SVC 76-initiated error recording process of type 70 MIH (Missing Interrupt Handler) records.

· i	WIHKEYN	ł	A*1	1	A*2	1	A*3	1	A*4	_1	MIHSPE1

## MN500: VM MONITOR INSTRUCTION SIMULATION CLASS RECORD

MN500 provides data on instructions simulated by CP.

		4
0	MN500UID	1
8	MN500INS	
С	MN500VAD	4
10	MN5000VH	400

Hexadecimal Displacement				Field Description, Contents, Meaning
0	MN500UID	DS	CL8	Userid
8	MN500INS	DS	1 F	Privileged instruction
С	MN500VAD	DS	1 F	Virtual storage addr of the instruction
10	M N 5000 V H	DS	XL8	Current total of CP simulation time
	MN500LEN	EQU	*-MN500	Length of CL4 code 0 record

## MN600DEV: VM MONITOR DASTAP CLASS DEVICE PORTION

MN600DEV provides I/O activity count for DASD and tape devices as invoked by CP monitor function.

0	MN600ADD	 I	MN600TY	1	MN600SER	1
8		MN600CNT				

He <b>x</b> adecimal Displacement	Field Name		Field Description, Contents, Meaning
0	MN600ADD DS	1 H	Device address
2	MN600TY DS	1H	VM/370 device type/codes
4	MN600SER DS	CL6	Volume serial number
A	MN600CNT DS	XL4	Device accumulated I/O count
	MN600DLN EQU	*-MN600DEV	Length of each data record
	MN600MAX EQU	(4096-MNBHDL	EN-MNHDRLEN-MN600HLN)/MN600DLN Maximum device count

#### MN600HDR: VM MONITOR HEADER RECORD FOR DEVICE PACKAGES

MN600HDR provides the number of device data packages.

	r				
	0	MN 600N UM	1	1	ĺ
	L				
Hexadecimal	Fie	1.6			

Hexadecimal Displacement				
0	MN600NUM	DS	H	

Field Description, Contents, Meaning Number of device data packages

#### MN700: VM MONITOR SEEKS CLASS RECORD

MN700 provides, via CP MONITOR, the I/O tasks and cylinder seek activity of a specified DASD device.

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	MN700UID DS	CL8	Userid
8	MN700ADD DS	1 H	Device address
A	MN700CYL DS	1H	Cylinder seeking to
С	MN700CCY DS	1 H	Current cylinder
E	MN700QDV DS	1X M*1	I/O tasks queued on the device
F	MN700QCU DS	1X M*2	I/O tasks queued on the control unit
10	MN700QCH DS	1X M*3	I/O tasks queued on the channel
11	MN700DIR DS	1X M*4	Seek direction; 00=lower, 01=higher
	MN700LEN EQU	*-MN700	Length of class 7 code 0 record

#### MN802CTR: VM MONITOR SYSPROF CLASS RECORD

MN802CTR provides, via CP monitor function, additional system profile data. The monitor data includes: the I/O activity for each device, the number of logged on users, number of page read/writes, plus total system I/O, page wait, and problem state time.

0	M N 8 0 2 N A U	l	MN802PGR

#### OWNDLIST: CP OWNED VOLUMES LIST

OWNDLIST contains a list of all the system owned DASD volumes that are used for paging, spooling, and temporary disk storage activity. Each entry specifies the volume identity and its preferred use (that is, paging/spooling/T-disk space). This block is generated by the SYSOWN macro at system generation time.

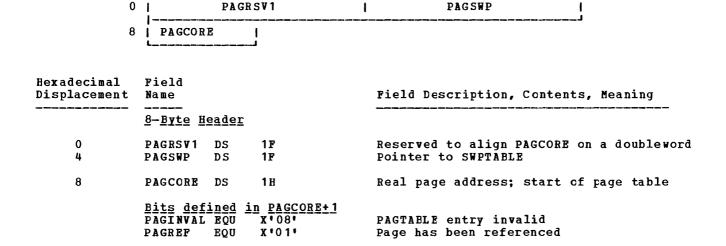

0		01	WNDVSER		   	OWNDRDEV	
Hexadecimal Displacement	Field Name			Field Des	scri	ption, Content:	s, Meaning
0	OWNDVSER	DS	CI6	Volume se	eria	l number	
6	OWNDRDEV	DS	1 H	Displacem	ent	of RDEVBLOK fo	or the volume
6	OWNDPREF	ORG DS	OWNDRDEV 1H	Allocatio	on p	reference	

#### PAGTABLE: PAGE TABLE

0

PAGTABLE is used by CP for allocating and referencing storage. It is referenced by the segment table (SEGTABLE) data area and contains a pointer to the swap table (SWPTABLE) which, in turn, is related to a DASD cylinder location.

PAGSWP

## PGBLOK: PSEUDO PAGE FAULT STACK BLOCK

PGBLOK is used by VM/VS Handshaking. The block is created and stacked when a multiprogramming or multitasking VS1 program interrupt occurs when a referenced page is not available in storage.

	0	PG	PNT		PGADDR
Hexadecimal Displacement		Field Name ——— PGPNT	DS	1 <b>F</b>	Field Description, Contents, Meaning Pointer to next PGBLOK on the stack
4		PGADDR PGBSIZE	DS EQU	1F (*-PGBLOK)/8	Virtual page fault address PGBLOK size in doublewords

## PSA: PREFIX STORAGE AREA (LOW STORAGE LOCATIONS)

PSA is the primary control block for controlling CP and virtual machine activity. This control block contains the normal low core IPL, logout and PSW information, the power and features of the processor, save areas used by BALR and FREER. This block also contains monitor and trace data and the necessary linkages to virtual machines, real devices, and spool files.

#### REAL I/O CONTROL BLOCKS

In order to control the activity of the I/O devices of the system and schedule I/O requests upon them, I/O control uses several types of control blocks. These blocks can be separated into two basic types:

- Static blocks that describe the components of the I/O system.
- Dynamic blocks that represent active and pending requests for I/O operations.

The I/O components of the real system are described by one control block for each channel, control unit, and device available to the control program. Units present but not represented by control blocks are not available for either user-initiated or control program-initiated operations.

<u>RCHBLOK</u>: For each channel attached to the system there exists a Real Channel Control Block (RCHBLOK) which contains:

- The channel portion of the address of its attached units,
- Status flags indicating the channel's availability for scheduling.
- A two-way queue anchor pointing to the list of I/O requests waiting to use the channel.

In addition, each RCHBLOK contains 32 half-word indexes, arranged in ascending address order, that represent the displacement into the Real Control Unit table of the control blocks for the control units attached to the channel. The 32 entries are required because the control unit address may be made up of five bits from the unit address. To locate the control block for a given unit:

- Index into the table in the RCHBLOK a displacement equal to twice the control unit address.
- 2. Load the index value.
- Add the value to the base address of the Real Control Unit Table.

RCUBLOK: The Real Control Unit Table is composed of Real Control Unit Blocks (RCUBLCK), one for each control unit on the system. These blocks are similar to the RCHBLOK in that they contain the control unit portion of the address and status flags, and a pointer to a queue of I/O requests. In addition, the RCUBLOK contains a pointer to the RCHBLOK for the

channel to which it is attached. The RCUBLOK contains a table of 16 halfword entries that represent the displacment into the Real Device Table of its attached devices. This table is referenced in the same manner as the table in the RCHBLOK.

RDEVBLOK: Each device and 3270 remote communications line in the system is represented by a Real Device Control Block and 3270 remote (RDEVBLOK), contains the device portion of the unit address and status flags similar to those in RCHBLOK and RCUBLOK. There is also a pointer for those operations that are waiting for the device to become available. Fields that appear in the RDEVBLOK and not in the other blocks include a pointer to the I/O request that is currently active on the device, SIO counts, and a pointer to error and sense The RDEVBLOK contains information. pointer to the RCUBLOK for the control unit to which it is attached and fields of device dependent information which do not affect the operation of I/O control.

If the RDEVBLOK is associated with 3270 remote communications line, then the RDEVBLOK contains a pointer to NICBLOKs that represents the resources on that line.

<u>IOBLOK</u>: I/O requests that are active in the system are represented by IOBLOKs. There is one IOBLOK for each operation (that is, channel program) to be executed. The IOBLOK is constructed by the requesting task and contains such information as:

- The identity of the requestor
- The address of the channel program to be executed
- The address to which control is to be returned upon completion of the operation

In addition, the IOBLOK contains status flags that indicate the current state of the operation (such as, whether or not an error has occurred, if an error recovery procedure (ERP) is in control, and the condition returned from the SIO) and the CSW associated with the interrupt that signals the end of the operation. Since IOBLOKS are queued off various I/O control blocks, they also contain forward and backward queue pointers. DMKIOS builds in them the real device address of the unit on which the operation is started.

In general, the IOBLOK representing a given operation progresses through the system by being queued, in turn, from device, control unit, and channel blocks until a path is at last free to the

device. A SIO is then issued. After the operation is complete, the IOBLOK is dequeued from the RDEVBLOK and stacked on a queue maintained in the dispatcher, DMKDSP. Each time the dispatcher is entered, the entries on the queue are unstacked and control is passed to the point specified in the Interrupt Return Address (IOBIRA). After I/O control stacks the IOBLOK for the given task, it attempts to restart all of the components that have been freed by the completion of the operation.

<u>NICBLOK</u>: There is one Network Interface Control Block for each defined 3704 or 3705

and each resource attached to a 3270 bisync line. The NICBLOK provides the correspondence between the line or device address and the physical resource connected to that line. This block not only defines the identity of the terminal type, line, or control unit but it also contains flags and status information pertaining to that resource. If the defined resource is a remote 3270 component, the NICBLOK contains the current line co-ordinates, polling and selection characters information as well.

The remainder of this section describes the real I/O control blocks.

## RCHBLOK: REAL CHANNEL BLOCK

RCHBLOK contains status and type information for the specified channel. The linkage to I/O tasks operated on by that channel and to the control units attached to that channel is also maintained.

## RDEVBLOK: REAL DEVICE BLOCK

RDEVBLCK is generated by the RDEV macro at system generation time. There is one RDEVBLOK for each real device and one for each binary synchronous line. The block contains status and device parameters applicable to I/O instruction processing.

#### RECBLOK: DASD PAGE (SLOT) ALLOCATION BLOCK

RECBLOK maintains the correlation of DASD storage pages to a specific cylinder location. Also maintained is a bit map to indicate the page slots available for data page storage.

	r							7			
0	RECPNT	1	RECCYL	1	R * 1	- 1	R*2	1			
								i			
8	RECMAP										
	ì							- ;			

Hexadecimal Displacement					Field Description, Contents, Meaning
0	RECPNT	DS	1 F		Pointer to next RECBLOK on chain
4	RECCYL	DS	1 H		Cylinder address for pages in this block
6 -	RECUSED	DS	1 X	R*1	Number of pages currently in use
7	RECMAX	DS	1 X	R*2	Maximum number of pages available
8	RECMAP	DS:	1 L		Page allocation bit map (128 pages maximum)

Bits defined in RECMAP 0 - Page is available

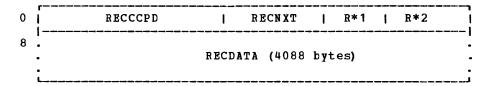

1 - Page has been assigned

RECSIZE EQU (\*-RECBLOK) /8 RECBLOK size in doublewords (X'03')

 $\underline{\text{Note}}$ : Although the size of RECMAP is fixed, the maximum number of pages available on a cylinder is device dependent. Bits corresponding to pages not physically present on a cylinder are set to 1.

### RECPAG: ERROR RECORDING PAGE RECORD

RECPAG retains up to 4K bytes of error recording data for eventual placement on the specified error recording cylinder.

Hexadecimal Displacement	Field Name	Pield Description, Contents, Meaning
0	RECCCPD DS 4X	CCPD of the record
4	RECNXT DS 2X	Displacement to next error record
6	RECFLAG1 DS 1X R*1	
7	Bits defined in RECFLAG1 RECPAGIU EQU X'80' RECPAGFR EQU X'40' RECPAGFL EQU X'20' RECPAGER EQU X'10' RECFLAG2 DS 1X R*2	Page contains valid data Page is cleared Page is full of error records Next page is unreadable (I/O error) Record format flag
	Bits defined in RECFLAG2 RECPAGEM EQU X 80 PRECPAGEN EQU X 00 PRECPAGE	Set in page 1 of a recording cylinder when the cylinder is being formatted. This flag bit is reset when all pages are cleared. Cylinder formatted
8	RECDATA DS 4088C	Data area
	RECPAGSZ EQU (*-RECPAG)/8	Size of page in doublewords (X'512')

## RSPLCTL: REAL SPOOL CONTROL BLOCK

RSPLCTL is used in conjunction with SFBLOK for processing closed spool files.

0	RSPRSTRT	I	RSPDPAGE
8	RSPVPAGE	1	RSPRPAGE
10	RSPMISC		RSPSFBLK

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	RSPRSTRT	DS	1 P	Restart CAW - CCW address
4	RSPDPAGE	DS	1 F	DASD location (DCHR) of current page buffer
8	RSPVPAGE	DS	1 F	Virtual address of page buffer
C	RSPRPAGE	DS	1 F	Real address of page buffer
10	RSPMISC	DS	1 F	Use varies according to caller
14	RSPSFBLK	DS	1 F	Pointer to SFBLOK for file
	RSPSIZE	EQU	(*-RSPLCTL)/8	Size in doublewords (X'03')

### <u>SA VEAREA</u>

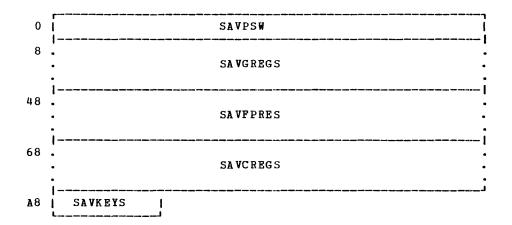

SAVEAREA is used to save the registers of a module when that module has called another module.

0	SAVERETN	l	SAVER12
8	SAVER13		SAVEWRK1
10	•	SAVEREGS	
40	SAVEWRK2	1	SAVEWRK3
48	SAVEWRK4	1	SAVEWRK5
50	SAVEWRK6	1	SAVEWRK7
58	SAVEWRK8	1	SAVEWRK9

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	SAVERETN	DS	1 <b>F</b>	Active SAVEAREA (caller's return address)
		ORG	SAVERETN	
0	SAVENEXT	DS	1 F	Inactive SAVEAREA (next SAVEAREA address)
4	SAVER12	DS	1 F	Caller's base (R12)
8	SAVER 13	DS	1 F	Caller's SAVEAREA (R13)
С	SAVEWRK1	DS	1 F	Called routine's work area
10	SAVEREGS	DS	12F	Caller's registers (RO to R11)
		ORG	SAVEREGS	
10	SAVERO	DS	1 F	
14	SAVER1	DS	1 F	
18	SAVER 2	DS	1 F

20	SAVER4	DS	1 F	
24	SAVER5	DS	1 F	
28	SAVER6	DS	1 F	
2C	SAVER7	DS	1 F	
30	SAVER8	DS	1 F	
34	SAVER9	DS	1 F	
38	SAVER 10	DS	1 F	
3C	SAVER11	DS	1 F	
40	SAVEWRK2	DS	1 F	Called routine's work area (8 fullwords)
44	SAVEWRK3	DS	1 F	
48	SAVEWRK4	DS	1 F	
4C	SAVEWRK5	DS	1 <b>F</b>	
50	SAVEWRK 6	DS	1 F	
54	SAVEWRK7	DS	1 F	
58	SAVEWRK8	DS	1F	
5C	SAVEWRK9	DS	1 F	
	SAVESIZE	EQU	(*-SA VEAREA)/8	Size in doublewords (X'OC')

### SAVTABLE: FIRST PAGE ON SAVED SYSTEM DASD

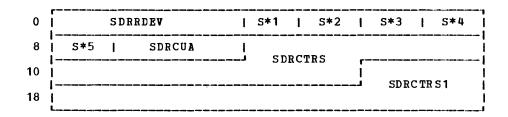

SAVTABLE is used in the initial program loading of saved virtual machine named systems. It is created by the name system generation process (SAVESYS macro/SAVESYS command).

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	SAVPSW DS	1 D	PSW of virtual machine at SAVSYS table
8	SAVGREGS DS	16F	General registers
48	SAVFPRES DS	4 D	Floating-point registers
68	SAVCREGS DS	16F	Control registers
A 8	SAVKEYS DS	1 H	2-byte entry for each saved page containing storage keys for each page

# SDRBLOK: STATISTICAL DATA RECORDING BLOCK

Contains counters to record temporary errors on a given I/O device.

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	SDRRDEV DS	1 <b>F</b>		Address of associated RDEVBLOK
4	SDRFLAGS DS	1 X	S <b>*1</b>	SDRBLOK flags
	Bits defined SDRSHRT EQU SDRFLCT EQU	in SDRFLAGS X'80' X'40' X'20' X'10' X'08' X'04' X'02' X'01'		Short OBR to be written Full byte counter
5	SDRPRMCT DS	1 X	S * 1	Parameter list counter
6	SDRRSV1 DS	1 H		Reserved for IBM use
8	SDRLNGTH DS	1 X	S*3	Length, in bytes, of SDR counters
9	SDRCUA DS	3 <b>X</b>		
С	SDRCNTS DS	5 <b>F</b>		SDR error counters

#### SEGTABLE

# SEGTABLE: SEGMENT TABLE

SEGTABLE is used in conjunction with the page table (PAGTABLE) and swap table (SWPTABLE) by the page management routines.

0	SEGPAGE		
Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	SEGPAGE DS	1 F	Pointer to page table
_	<u>Page Table Le</u> ORG	SEGPAGE	
0	SEGPLEN DS	1 X	Page table length (Total pages - 1) (in left half of byte)

## SFBLOK: SPOOL FILE BLOCK

SFBLOK retains all the information relating to a spool file. A pointer provides a linkage to the next SFBLOK in the chain.

0	SFBPNT	1	SFBSTART		
8		SFBUSER			
10		SFBORIG			
18	SFBRECNO	<u>-</u>	SFBRECSZ	SFBFILID	
20	S*1   S*2   SFBM	ISC1	SFBRECS

58		SFBDIST			
,					

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	SFBPNT DS	1 F		Pointer to next SFBLOK
4	SFBSTART DS	1F		DASD location (DCHR) of last page buffer
8	SFBUSER DS	CL8		VMUSER identification of file owner
10	SFBORIG DS	CT8		VMUSER identification of file origin
18	SFBRECNO DS	1 F		Number of data records in file
1C	SFBRECSZ DS	1 H		Logical record size - excluding CCWs
1 E	SFBFILID DS	<b>1</b> H	,	Binary system file number
20	SFBFLAG DS	1 X	S*1	SFBLOK control bits
	Bits defined SFBINUSE EQU SFBRECOK EQU SFBUHOLD EQU SFBOPEN EQU SFBOPEN EQU SFBSHOLD EQU SFBEOF EQU SFBRECER EQU	X'80' X'40' X'20' X'10' X'08'		File being processed Allocation records complete File in user hold status File is a CP system dump Input file has been opened File in system hold status Input file has reached EOF SFBREC chain incomplete
21	SFBTYPE DS	1 X	s*2	Device type for output
22	SFBMISC1 DS	1 H		Use varies according to caller
24	SFBRECS DS	1 <b>F</b>		Pointer to RECBLOKS for active file
28	SFBFNAME DS	CL12		Filename

Hexadecimal Displacement					Field Description, Contents, Meaning
34	SFBFTYPE	DS	CL12		Filetype
	SFBDATE				Creation date of spool file
48	SFBTIME	DS	CT8		Creation time of spool file
	SFBLAST				DASD location (DCHR) of last page buffer
54	SFBCOPY	DS	1 H		Number of copies requested
56	SFBCLAS	DS	1C	S*3	Spool output class
	SFBFLAG2				
	SFBHOLD	EQU	n <u>sfbflag</u> x • 80 • x • 40 •		Save input file, or hold output file Delete input file, or do not hold ouput file
	<u>Note</u> : SF	BHOLD	and SFENO	HLD ov	erride options in VDEVBLOK.
	SFBREQUE	EQU	X'20'		Re-queue spool file
			X'10'		Restart in progress
	SFBTICER	EQU	X * 08 *		Buffer TIC error
	SFBPURGE	EQU	X 1 04 1		Purge open spool file
	SFBFIRST	EQU	X 02		Indicate first page written
58	SFBDIST	DS	CL8		Distribution code
	SFBSIZE	EQU	(*-SFBLO	K)/8	Size in doublewords (X'OC')

# SHQBLOK: SPOOL HOLD QUEUE BLOCK

SHQBLOK provides a holding function for identified spool files to prevent output to another user or to a real output device.

	L							-1
0	SHQPNT	1	S*1	-1	S*2	1	SHQSPARE	- 1
	1	·		•		•	<b>E</b>	:
								-1
8	SHQUSER							- 1
	<u> </u>							i

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	SHQPNT DS	1F	Address of next SHQBLOK
4	SHQFLAGS DS	0CL4	Length
4 5	SHQUHOLD DS SHOSHOLD DS	1X S*1 1X S*2	User USER HOLD flag byte User SYSTEM HOLD flag byte
	<u>Bits defined i</u> TYPPRT TYPPUN	n SHQUHOLD and	SHOSHOLD Used for printer type Used for punch type (see Appendix A for DEVTYPES for both TYPPRT and TYPPUN)
6	SHQSPARE DS	2 X	Reserved for IBM use
8	SHQUSER DS	CT8	VMUSER identification of file owner
	SHQBSIZE EQU	(*-SHQBLOK)/8	Size in doublewords (X'02')

## SHRTABLE: NAMED-SHARED SEGMENT SYSTEMS TABLE

SHRTABLE contains pointers to the segment locations of named systems for both the shared and nonshared user. This block is used in paging, IPL, and VMA operations.

0	SHRPPNT		SHRBPNT	
8	S	HRNAME		
10	SHRTSIZE   SHRUSECT	I	SHRSEGCT	
18	SHRSEGNM	ı	SHRPAGE	   

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	SHRFPNT	DS	1 F	Pointer to next SHRTABLE
4	SHRBPNT	DS	1 <b>.</b> F	Pointer to previous SHRTABLE
8	SHRNAME	DS	CT8	Name of saved system
10	SHRTSIZE	DS	1H	Size of SHRTABLE in doublewords
12	SHRUSECT	DS	1 H	Number of users using to this segment name
14	SHRSEGCT	DS	1 F	Number of shared segments
18	SHRSEGNM	DS	1F	Contains shared segment numbers; up to four segment numbers per word.
1C	SHRPAGE	DS	1 <b>F</b>	Pointers to each of the shared SEGTABLEs. There is one word for each shared segment. The entry is the same as S*1 SEGPAGE in "SEGTABLE: Segment Table."

# SPLINK: SPOOL PAGE BUFFER LINKAGE BLOCK

SPLINK resides in auxiliary storage and contains one page (4096 bytes) of unit record spool information consisting of data and all required CCWs.

0	SPNXTPAG	1 SPPREPAG
8	SPRMISC	SPRECNUM
10	SPOOL	BUFFER DATA AREA (4080 bytes)

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	SPNXTPAG DS	1 F	DASD location (DCHR) of next page buffer
4	SPPREPAG DS	1 F	DASD location (DCHR) of previous page buffer
8	SPRMISC DS	1 F	Use varies according to caller
С	SPRECNUM DS	1 F	Number of data records in buffer
	SPSIZE EQU	(*-SPLINK)	Size in bytes (X'10')

#### SWPTABLE: SWAP TABLE FOR VIRTUAL MACHINE PAGING

SWPTABLE is used in conjunction with the page table (PAGTABLE) and the segment table (SEGTABLE) by the CP page management routines for relating the virtual storage to DASD slots and real storage.

0	 	Si	P	7 M					ı	SWPPAG					-7
8	   	S*1		S*2	1	S*3	1	S*4	ı	SWPCYL	ı	S*5	1	S*6	

Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning
0	SWPVM	DS	1 F		Pointer to VMBLOK
4	SWPPAG	DS	1 F		Pointer to PAGTABLE
8	SWPFLAG	DS	1 X	S*1	SWPTABLE flag bits
	Bits def	ined	in SWPFLAG		
	SWPTRANS	EQU	x • 80 •		Page in transit
			X 40		Page permanently assigned
	SWPALLOC	EQU	X'20'		Page enqueued for allocation
	SWPSHR	EQU	X 1 10 1		Page shared
	SWPREF1	EQU	X • 0 8 •		First half page referenced
	SWPCHG1	EQU	X • 04 •		First half page changed
	SWPREF2	EQU	X'02'		Second half page referenced
	SWPCHG2	_			Second half page changed
9	SWPVPAGE	DS	1 X	S*2	Virtual page number
A	SWPKEY 1	DS	1 X	S*3	
В	SWPKEY2	DS	1 X	S*4	Virtual storage key
С	SWPCYL	DS	1 H		DASD cylinder address
	SWPDPAGE	DS	1 X	S*5	
E F	SWPCODE	DS	1 X	S*6	RDEVBLOK device code
					(The device code is used as an index into
					the list of CP-owned paging volumes pointed to
					by DMKSYSOW)

<u>Note</u>: For each SWPTABLE there is only one doubleword that consists of SWPVM and SWPPAG followed by 16 entries (one for each PAGTABLE entry) that consist of S\*1, S\*2, S\*3, S\*4, SWPCYL, S\*5, and S\*6. Thus, the total size of the SWPTABLE is 17 doublewords.

# SYSLOCS: SYSTEM LOW STORAGE INFORMATION BLOCK

SYSLOCS contains user logon and dial statistics, time/date and log message data, TOD values, and line edit values.

0	[		DMKSYSDT			
8			DMKSYSTM			
10	! !	<del></del>	DMKSYSLW

#### VIRTUAL I/O CONTROL BLOCKS

The base for locating the I/O block structure is the user's Virtual Machine Block (VMBLOK). The VMBLOK contains a pointer to the start of three control block tables, and a table of 16 channel indexes. The control block tables contain one block for each of the virtual channels, control units, and devices that are defined for the user's virtual machine. The entries in the channel index table (VMCHTBL) contain the pointers to each channel defined for the user in the table of Virtual Channel Blocks (VCHBLOKS). Each VCHBLOK contains a table of pointers that point to the Virtual Control Unit Blocks (VCUBLOKS) for the control units attached to that virtual channel. Each VCUBLOK contains pointers to the Virtual Device Blocks (VDEVBLOKS) attached to the control unit.

Thus, if given the unit address of any component in the form ccu, the appropriate control blocks representing each component in the subchannel path to the given unit is located via the indexing scheme.

VCHBLOK: There is one VCHBLOK for each virtual channel connected to the user's virtual CPU. Each VCHBLOK contains the channel address and flag indicating the channel type (selector, byte multiplexer or block multiplexer). The status of the channel and its attached units are represented by several status and mask bytes, as follows:

- A status byte (VCHSTAT) indicates whether the channel is busy or has a channel class interrupt pending.
- A halfword unit address identifies the unit causing the channel-class interrupt (if it is present).

3. A halfword mask (VCHCUINT) contains a bit map of the attached control units that have interrupt status pending.

Following these status flags and masks is the table of indexes pointing to the attached VCUBLOKs; index entries representing addresses at which no control unit is attached have a value of -1.

<u>VCUBLOK</u>: There is one VCUBLOK for each control unit in the virtual configuration. These blocks are arranged in a table, and each contains, in addition to its base address, status flags similar to those in the VCHBLOK and a table of indexes to attached VDEVBLOKS. The status flags defined for the VCUBLOK differ from those for the VCHBLOK in that they can contain status for the control unit and also for a subchannel.

For example, if the VCUBLOK representing a 2803 Tape Control Unit is attached to a virtual selector channel, both the VCHBLOK and the VCUBLOK are marked busy. However, if the VCUBLOK is attached to a virtual byte multiplexer channel and is for a control unit on a selector subchannel of the multiplexer, the busy status of the channel is reflected in the VCUBLOK only. Thus the virtual multiplexer appears nonbusy to operations on other, nonshared subchannels.

<u>VDEVBLOK</u>: There is one VDEVBLOK in the configuration for each virtual device defined by the user. Each VDEVBLOK contains the device portion of the unit address, device status, and the virtual CSW for the last interrupt taken by the device. In addition, the VDEVBLOK contains device type specific information that allows the I/O translation and simulation routines to interpret the channel programs presented by the user.

## VCHBLOK: VIRTUAL CHANNEL BLOCK

VCHBLOK contains information providing linkage between the virtual machine and one of its virtual channels. Supplied in this block, in addition to channel status and type information, are the reflected interrupts from attached virtual control units.

#### VMBLOK: VIRTUAL MACHINE CONTROL BLOCK

VMBLOK is used as the primary control block for almost all activities related to a single virtual machine. This block contains the following information: the dispatch and priority level of the virtual machine, the virtual machine's CPU registers, preferred virtual machine option values, other values significant to virtual machine operations.

## VSPXBLOK: VIRTUAL SPOOL EXTENSION BLOCK

VSPXBLCK serves as an extension to the virtual spool control block (VSPLCTL). It contains the user-named destination of the file as well as RSCS tag information used by the Remote Spooling Communications Subsystem.

0	V*1   V*2   VSPXSPAR
8	VSPXDIST
10	VSPXXUSR
18	VSPXTAG

1	VSPXTGLN	DS	1X V*2	VSPXTAG data length (doublewords)
2	VSPXSPAR	DS	XI6	Reserved for IBM use
8	VSPXDIST	DS	CL8	Virtual device distribution code
10	VSPXXUSR	DS	CT8	Virtual machine user to whom the file is transferred
18	VSPXTAG	DS	CL136	Tag information data area
	VSPXSIZE	EQU	(*-VSPXBLOK)/8	VSPXBLOK size in doublewords (X'14')

#### XINTBLOK: EXTERNAL INTERRUPT BLOCK

XINTBLOK saves the various types of external interrupts that are presented to the virtual machine. If multiple external interrupt conditions are simultaneously presented, as indicated by values presented in the block, code exists for handling the interrupts in their defined hierarchical order.

0	XINTNEXT	1	XINTSORT   XINTCPUA	
8	XINTCODE   XINTMASK	ı	XINTPARM	

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	XINTNEXT DS	1F	Address of next external interrupt block

С	XINTPARM DS	1 F	External interrupt parameter word
	XINTSIZE EQU	(*-XINTBLOK)/8	XINTBLOK size in doublewords (X'02')

		•		
:				

This section contains CMS data areas and control blocks. Pigure 2 shows the relationships between the control blocks and data areas of CMS.

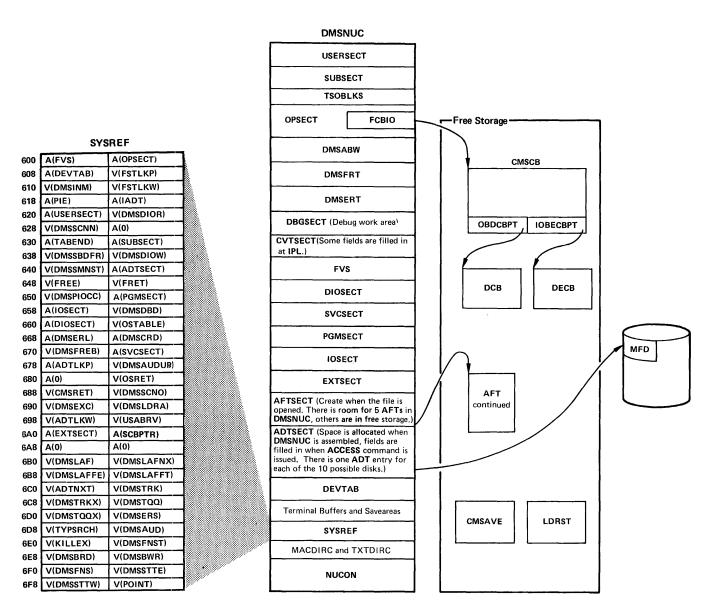

Figure 2. CMS Control Block Relationships

#### ABTAB: ABEND TERMINATION OPTION TABLE

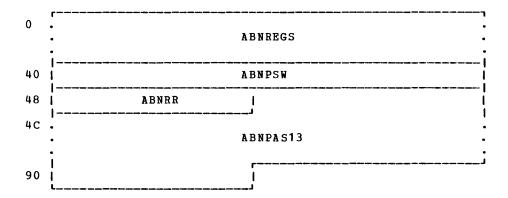

ABTAB contains one 8-byte entry for the background partition. Bytes 0-3 contain the address of the entry point of the user's abnormal termination routine. Bytes 4-7 contain the address of a 72-byte save area used by the supervisor to store the interrupt status information and the contents of the general registers.

The IJBABTAB field (hex 54) in the SYSCOM block points to the ABTAB block.

0		ABROUT		1	ABSAVE
Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning
0	ABTAB ABROUT ABSAVE	EQU DC DC	*-8 F'0' F'0'		ABEND option table Address of user termination routine Address of supervisor save area

## ABWSECT: ABEND RECOVERY WORKSPACE

V-constants in DMSABN, DMSDBG, DMSFRE, DMSITI, DMSITP, and DMSITS point to the ABWSECT block. ABWSECT is defined in module DMSABW.

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	ABNREGS DS	16F	Registers at time of ABEND
40	ABNPSW DS	D	PSW at time of ABEND
48	ABNRR DS	F	Temporary save area
4C	ABNPAS13 DS	18F	Area passed to nucleus routines
	Space for DMS	BRR PLIST	
94	ORG	ABNPAS 13	
4 C	ABNERLST DS	47X	

## ADTSECT: ACTIVE DISK TABLE

ADTSECT describes the attributes of virtual disks (A-Y) accessed by a virtual machine via the ACCESS command. Space is allocated for the ADT when DMSNUC is assembled. In the ADT, certain fields are defined for use by both CMS and OS. For example, field ADTHBCT at displacement 1C (hexadecimal) into ADTSECT is also defined as OSADTVTA for use by OS simulation routines. ADTSECT is invoked by the ADT macro.

0	ADTID	i	A*1   A*2
8	ADTPTR	i ADTDTA	
10	ADTFDA	ADTMFDN	
18	ADTMFDA	ADTHBCT

	ADTMXBML	-	10	Maximum bit map length (number of records) for 333(				
	NUCON Dey	<u> (ice T</u>	able Offsets					
	DTAD	EQU	0	Device number				
	DTADT DTAS	EQU EQU	3	Device type byte Symbolic device name				

## AFTSECT: ACTIVE FILE TABLE

AFTSECT is used to describe a file currently open for a read or write. The AFT is created when a file is opened. Space for up to five AFTs is available in DMSNUC; any others must reside in free storage. AFTSECT is invoked via the AFT macro.

_

#### ANCHSECT: ANCHOR TABLE

ANCHSECT defines the DOS/VS anchor table. This DSECT is used by DMSDOS when a CDLOAD (SVC 65) is issued, and the phase is not found in either the CMSVSAM or CMSAMS segment. In this case, the specified phase is loaded either from a CMS DOSLIB or a DOS Core image library, and the name, load point, entry point, and the length in bytes, of the phase are saved in an available slot in the anchor table. ANCHSECT is invoked by the ANCHTAB macro.

0	ANCHENDA	Reserved for IBM use
8	ANCHCBS	ANCHOAL
10		ANCHPHNM
18	ANCHLDPT	ANCHENTP
20	A*1   ANCHPHLN	

Hexadecimal Displacement	Field Name 		Field Description, Contents, Meaning
0	ANCHENDA DC	A (O)	End address of anchor table
4	DC	F • 0 •	Reserved for IBM use
8	ANCHCBS DC	A (O)	Pointer to VSAM AMCB table
С	ANCHCAL DC	A (0)	Pointer to VSAM OAL (OPEN ACB) table
	Followed by o	ne or more Ancho	r Table Entries of the following format:
10	ANCHPHNM DC	CL8' '	Phase name
18	ANCHLDPT DC	A (O)	Load point
1C	ANCHENTP DC	A (0)	Entry point
20	ANCHSTSW DC	X 00 A * 1	Status switch
	Bits defined		
	ANCHMLOD EQU	X • 00 •	Phase must be loaded
	ANCHINST EQU	X'7F'	Phase is already in storage
	ANCHRPJL EQU	X'FF'	Requested phase just loaded by another task (only if AP=YES)
	ANCHLENG EQU	20	Length of one anchor table entry
	ANCHSIZ EQU	1024	Default size of anchor table (in bytes)
21	ANCHPHLN DC	AL3 (0)	Length of phase in bytes

## BATLSECT

## BATLSECT: CMS BATCH USER JOB LIMITS

EATLSECT describes the fields in the user job limits table for CMS batch jobs. The ABATLIMT field (hex 45C) in NUCON points to the job limits table.

0	 	BATCPUL	ı	BATCPUC	1	BATPRTL	1	BATPRTC	1
8	[	BATPUNL	ı	BATPUNC	1			gege and an annual spirite and a make a make angula angula angula angula at tabb angula bilah kanana.	!

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	BATCPUL	DC	H'32767'	<pre>Virtual CPU limit (second);   can be reset</pre>
2	BATCPUC	DC	н • 0 •	Current CPU count; do not reset
4	BATPRTL	DC	н'32767'	<pre>Number printed lines limit;   can be reset</pre>
6	BATPRTC	DC	н•О•	Current line count; do not reset
8	BATPUNL	DC	н'32767'	Number punched cards limit; can be reset
A	BATPUNC	DC	H • O •	Current card count; do not reset

## BBOX: BOUNDARY BOX

BBOX contains the begin and end addresses of the virtual and real partitions, respectively.

The IJBBOX field (hex DC) in the SYSCOM block points to the BBOX block.

0	REALORP	1	REALNDP
8	VIRTORP		VIRTENDP

Hexadecimal Displacement	Field Name		Field Description, Contents, Meaning
0	REALORP DS	XL4	Origin of real partition
4	REALNDP DS	XL4	End of real partition + 1
8	VIRTORP DS	XL4	Origin of virtual partition
С	VIRTENDP DS	X L 4	End of virtual partition + 1
	<u>Equates for Fi</u>	<u>irst Entry in Bl</u>	<u>BOX</u>
	ALTSDAR EQU	REALORP	Address of alternate area
	MINREALP EQU	REALNCP	No. page frames in min. real partition
	MPGEPOOL EQU	REALNDP+2	No. page frames in main page pool
	ORIGVIRT EQU	<b>VIRTORP</b>	Origin of virtual storage
	FINVIRT EQU	VIRTENDP	End of virtual storage +1

## BGCOM: DOV/VS PARTITION COMMUNICATION REGION

BGCOM simulates the DOS/VS Partition Communication Region (BGCOM). The ABGCOM field (hex 4E0) in NUCON points to the BGCOM block.

0	r	JOBI	DATE
8	PPEG	EOSSP

## CHSTAKE: TERMINAL ATTENTION EXIT ELEMENT

CMSTAXE defines the fields used in a Terminal Attention Exit Element (TAXE). The TAXE is used mainly by DMSCIT for processing attention interrupts. CMSTAXE is invoked via the TAXE macro.

The TAXEADDR field (hex 5D4) in NUCON points to CMSTAXE.

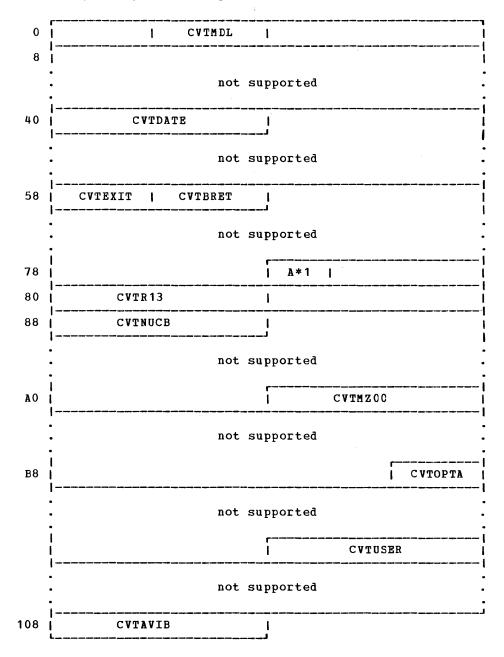

0	TAXESPSW	1	TAXEEXIT
8	TAXELNK		TAXEIOL
10	TAXETSOF		TAXERTNA
18		TAXEEXTS	{
	•		•
60	1	TAXEIOWS

9B	DS	1 X	Reserved for IBM use
9C	TAIEIAD DS	A	Right half I/O old PSW
ΑO	TAIERS AV DS	64F	Register 0-15 of interrupted program

#### CVTSECT: COMMUNICATION VECTOR TABLE AS SUPPORTED BY CMS

CVTSECT simulates the OS Communication Vector Table. CVTSECT is invoked via the CMSCVT macro.

The ACMSCVT field (hex 10) in NUCON points to CMSCVT.

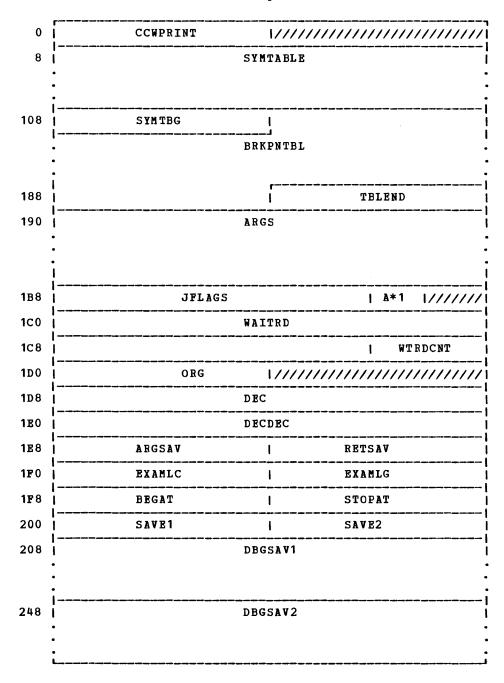

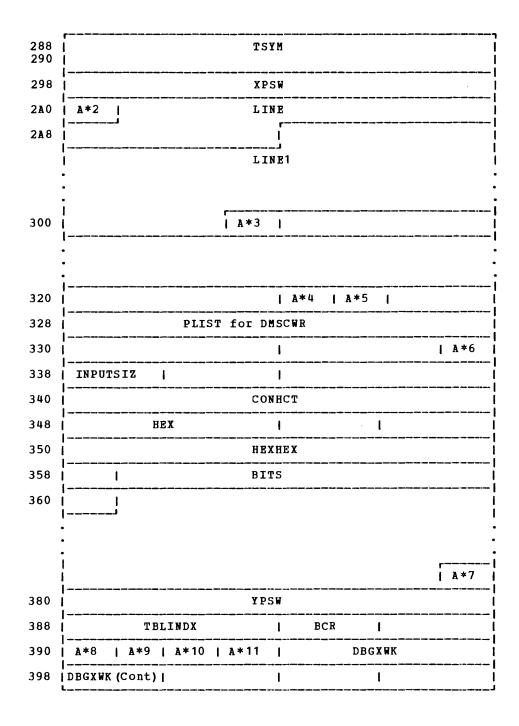

Hexadecimal Displacement	Field Name 			Field Description, Contents, Meaning		
	Communic	ation	<u>Vector Table as</u>	Supported by CMS

108	CVTAVIB	DC	V (DMSVIB)	Address of VSAM interface bootstrap		

#### DBGSECT: DEBUG WORK AREA

DBGSECT contains the files used by DEBUG for saving registers, breakpoints, PSWs, and other data.

V-constants in DMSDBD, DMSDBG, and DMSITE point to the DEBUG work area.

Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning

#### DEVIAB: DEVICE TABLE

DEVIAB contains the entries for the various devices handled by CMS (disks, tapes, reader, punch, printer, and console).

The device table is pointed to by V-constants in DMSIOW and DMSITI, and is also referenced indirectly by the ADEVTAB field (hex 608) in NUCON.

### DIOSECT: DISK I/O WORK AREA

 $\hbox{\tt DIOSECT describes the fields used by $\tt DMSDIO$ as a work area when reading and writing actual blocks of data on CMS disks.}$ 

The Disk I/O Work Area is pointed to by a V-constant in DMSNUC, and referenced indirectly by ADIOSECT (hex 660) in NUCON.

# DMSCCB: COMMAND CONTROL BLOCK

DMSCCB describes all fields of a DOS Command Control Block (CCB). This DSECT is used by DMSXCP to map the CCB specified by a user for an SVC 0 (EXCP).

### DOSSECT: DOS SIMULATION CONTROL BLOCK

DOSSECT simulates the CMS File Control Block (FCB) in the CMS/DOS environment. DOSSECT is invoked by the DOSCB macro.

The DOS Simulation Control Blocks are chained together. The DOSFIRST field (hex 4F0) points to the first DOSCB in the chain or if no chain exists contains zero.

### EDCB: EDIT CONTROL BLOCK

 $\tt EDCB$  is used by all CMS EDIT modules to define common free storage control blocks. It is initialized by <code>DMSEDX</code>, the <code>EDIT</code> bootstrap routine.

# ERDSECT: ERROR HANDLING ROUTINE DSECT

<code>ERDSECT</code> describes the fields in a work area  $\,$  used for giving responses and error messages via the <code>DMSERR</code> or <code>LINEDIT</code> macros.

A V-constant in DMSERR points to the DMSERT DSECT.

#### EXTUAREA: EXTERNAL USER AREA

EXTUAREA is a 96-byte user area generated by the CMSAVE macro. The pointer to the user area is passed to the user via register 13. The field USAVEPTR (hex 8C) in CMSAVE also points to the user area.

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning

### FCBSECT: SIMULATED OS CONTROL BLOCKS

FCBSECT consists of the CMS File Control Block (FCB) (used for file management under CMS), the simulated OS Job File Control Block (JFCB), Input/Output Block (IOB), and Data Extent Block (DEB). FCBSECT is invoked via the CMSCB macro.

#### FCHTAB: FETCH TABLE

FCHTAB contains a fetch/load parameter list that points to a 34-byte directory list. The fetch table is used when a DOS program issues a LOAD or FETCH request without the 'LIST=' parameter.

The IJBFTTAB field (hex FO) in the SYSCOM block points to the fetch table.

# FICL: FIRST IN CLASS BLOCK

FICL is a 2-byte table used in CMS/DOS to address system and programmer logical unit blocks.

Byte 0 of FICL points to the first system class logical unit in the LUB table. This is always the first entry in the LUB table. The second byte points to the first programmer class logical unit in the LUB table partition area.

The FICLPT field (hex 48) in the BGCOM block points to the FICL block.

#### FRDSECT: FREE CHAIN ELEMENT HEADER BLOCKS

FRDSECT describes the fields used by DMSFRE to reference the four free chain element header blocks. FRDSECT is invoked by the macro DMSFRT.

The DMSFRT DSECT is pointed to by a V-constant in DMSFREE, and also by the ADMSFRT field (hex 530) in NUCON.

Hexadecimal Displacement	Field Name The Foll	<u>lcwing</u>	Field Description, Cont

24

26

#### FSTSECT: FILE STATUS TABLE

The file status tables for all files on the disk are grouped into 800-byte disk records referred to as file status table blocks (FSTBs). Each file status table block can accommodate up to 20 file status tables.

#### FYSECT: FIXED VARIABLE STORAGE WORK AREA FOR CMS FILE SYSTEM

FVSECT is used mainly by file management and I/O routines. FVS contains save areas, work areas, and commonly used constants. A typical use of FVS, is when a reentrant I/O routine requires a work area or save area, since the routine cannot modify itself. FVSECT is invoked by the FVS macro.

### IOSECT: I/O INTERRUPT SAVE AREA

IOSECT describes the fields used by  $\tt DMSITI$  for save registers, I/O old PSW, and other data when handling I/O interrupts.

IOSECT is pointed to by the AIOSECT field (HEX 658) in NUCON.

0	IOSAVE	1

#### LUBTAB AND LUBPR: LOGICAL UNIT BLOCK TABLE

LUBTAB is a device table that has a two-byte entry for each symbolic name used by CMS/DOS. The simulated LUB has 255 entries: 14 entries for the system logical units and 241 entries for programmer logical units. System devices (SYSRDR, SYSIPT, SYSPCH, SYSLST, and SYSLOG) can be assigned to alternate devices. The system and programmer tables are defined with separate DSECTS: LUBTAB and PRTAB. LUBTAB is pointed to by the field LUBPT in BGCOM. The address of the first LUB entry is in the first byte of the FICL control block.

### NICL: NUMBER IN CLASS

Byte 0 of the Number In Class block (NICL) contains the number of system class logical units. The second byte contains the number of programmer class logical units for the partition.

The NICLPT field (hex 4A) in the BGCOM block points to the NICL block.

### OSFST: OS FILE STATUS TABLE

OSFST describes the fields of an OS file status table. When an OS disk is accessed, DMSROS builds and fills in an OSFST block, which is comparable to a CMS FST block. This block is released by DMSALU.

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	OSFSTFM DS	1 H		Disk mode
2	DS	1 H		Reserved for IBM use
4	OSFSTBLK DS	1 H		Block size

118	I	DS OD		
	OSFSTLTH E	EQU (*-	-OSFST) /8	OS FST length in doublewords

#### OVSECT: DESCRIBES THE FIRST FEW LOCATIONS OF DMSOVS

OVSECT is used by module DMSOVS to provide trace information requested by SVCTRACE.

0	OVSGO	 	AERR
8	AWAIT		LENOVS

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
	This Mac	cro Des	cribes the	e First Few Words of the DMSOVS Module
0	OVSGO	В	*-*	Branch to this point for TRACE
4	AERR	DC	A (0)	Address of DMSERR
8	AWAIT	DC	A (O)	Address of CONWAIT
С	LENOVS	DC	A (0)	Length of DMSOVS doublewords

### PCTAB: PROGRAM CHECK OPTION TABLE

PCTAB is used by DOS/VS routines in the event of a program check. The address of PCTAB is in bytes  $X^{1}64^{1}$  and  $X^{1}65^{1}$  of the partition communication region (BGCOM).

	L	
0	PCROUT	PCSAVE
	L	

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
	PCTAB	EQU	*-8	
0	PCROUT	DC	F . O .	Program check routine
4	PCSAVE	DC	F • O •	Program check save area

PCROUT can contain one of three values: zero (indicating that no STXIT macro was issued), the address of a user program check routine (indicating that th STXIT macro was issued), or the complement of the address of a user program check routine (indicating that the routine specified in the user STXIT macro was already in use).

PCSAVE can contain either zero (indicating that no STXIT macro was issued), or the address of the user save area (indicating that the STXIT macro was used).

# PDSSECT: DIRECTORY TABLE FOR BPAM SIMULATION

PDSSECT describes the fields of the in-storage directory that is used in OS simulation of  $\mathtt{BPAM}$ .

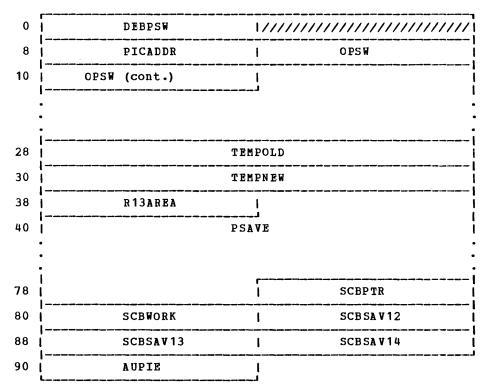

0		DIRNAME	DIRPTR
8	A*1   A*2	CORESIZE   PD:	SBLKSI   A*3  ///////

Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning
0	DIRNAME	DS	3Н		MACLIB identifier
6	DIRPTR	DS	1 H		Item pointer to start of directory
8	TEMPBYTE	DS	1 X	A*1	If \$ , then PDS is in \$PDSTEMP file
9	NEWBLKS	DS	1 X	A*2	No. new blocks added to PDS by STOW
A	CORESIZE	DS	1 H		Size of dictionary in bytes
С	PDSBLKSI	DS	1 H	A*3	Block size of dictionary
E	CHNGBYTE	DS	1 X		Indicates updates to directory
F		DS	1 X		Reserved for IBM use
10	PDSDIR	DS	0F		Start of in-storage directory

#### PGMSECT: PROGRAM INTERRUPT WORK AREA

PGMSECT describes the fields used by DMSITP for saving registers, old PSW, and other data for handling program interrupts.

The PGMSECT DSECT is pointed to by the APGMSECT field (hex 654) in NUCON.

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
	Storage	for Pro	ogram Interrupt	Routine (DMSITP)
0	DEBPSW	DC	F'O', V (DMSDBG)	Point to debug
8	PIE	DS	0 D	Program interrupt element
8 C 14	PICADDR OPSW	DC DC DC	F'0' 2F'0' 5F'0'	PICA address from recent SPIE Old PSW after program interrupt Regs: R14,R15,R0,R1,R2
				End program interrupt element
28 30 38 3C	TEMPOLD TEMPNEW R13AREA PSAVE	DC DC DC DC	8X'00' 8X'00' F'0' 16F'0'	Work area Saved R13 Regs saved at interrupt time

### PGMSECT

Hexadecimal Displacement	Field Name	Field Description, Contents, Meaning
7C	SCBPTR DC F'0'	Pointer to first STAE control block
	Bits defined in SCBPTR STAEBIT EQU X'80' STAIBIT EQU X'40' RETRYBIT EQU X'20'	
80 84 88 8C	SCBWORK DC A (0) SCBSAV12 DC A (0) SCBSAV13 DC A (0) SCBSAV14 DC A (0)	Address of work area for STAE exit routine Address of reg 12 save area for DMSSAB Address of reg 13 save area for DMSSAB Address of reg 14 save area for DMSSAB
90	AUPIE DS A	Address of user's PIE, in SPIE exit

## PIBADR: PROGRAM INFORMATION BLOCK

PIBADR contains a save area address and interrupt information. PIBADR is invoked by the PIBTAB macro and is often referred to by this macro name. The PIBPT field (hex 5A) in the BGCOM block points to the PIBADR block.

0	A*1   A*2   PIBLOGID	PIBSAVE
8	PIBSAV2	A*3   A*4   A*5   A*6

Hexadecimal Displacement	Field Name				Field Description, Contents, Meaning
0	PIBFLG	DS	X	A * 1	Flags
1	PIBCNCL	DS	X	A * 2	Cancel code
2	PIBLOGID	DS	XL2		SYSLOG ID
4	PIBSAVE	DS	X L 4		Address of save area
	ARFLG	EQU	PIBADR+8		Save area address
8	PIBSAV2	DS	XL4		Address of system save area
С	PIBPUBAS	DS	X	A*3	
D	PIBLUBID	DS	X	A * 4	LUB no. of first problem program LUB
E	PIBLUBNO	DS	С	A*5	Number of LUBs
F	PIBFLG2	DS	С	A*6	More flags
		ORG	PIBADR		PIB extension DSECT
0	PIBCOMRA	DS	XL2		Communication region address
2	SYSLUBX	DS	XL2		System class LUB address
4	INTINFO	DS	XL4		Interrupt information
	SVCIC	EQU	INTINFOX3		-
8	PIBECB	DS	XL2		Program interrupt key
A		DS	XL2		Reserved for IBM use

## PIB2TAB: PROGRAM INFORMATION BLOCK EXTENSION

PIB2TAB is an extension of the PIBTAB block. For each PIB table entry, an entry exists in the PIB table extension block (PIE2TAB).

The PIB2PTR field (hex 7C) in the BGCOM block points to the PIB2TAB block.

0	PIBCOMR1	SYSLUBX		INI	TINFO
8	PIBE	СВ	1	PIBPIK	1//////////////////////////////////////

	Field Name			Field Description, Contents, Meaning
0	PIBCOMR1	DS	XL2	Address of communications region
2	SYSLUBX	DS	XL2	System LUB index
4	INTINFO	DS	XL4	Used for interruption code
	SVCIC	EQU	INTINFO+3	SVC interrupt code
8	PIBECB	DS	XL4	Address of termination ECB, if any
С	PIBPIK	DS	XL2	Program interrupt key
E		DS	XL2	Reserved for IBM use

### PUBADR: PHYSICAL UNIT BLOCK TABLE

PUBADR is a table defining the physical devices being used by CMS/DOS. The simulated PUBADR has eighteen 8-byte entries, one for each device supported by CMS. Also included here is the DSECT used by DOS/VS routines. Both DSECTs define the same storage. The simulated PUBADR is invoked by the MAPPUB macro; the DOS/VS DSECT is invoked by the PUBTAB macro.

The address of the PUBACR is at displacement X'40' of BGCOM.

	L											٦.

2		DS	X		Reserved for IBM use
3	PUBDSKM	DS	X	A * 1	Disk mode if assigned DASD
LĻ	PUBDEVT	DS	X	A*2	Device type code
5	PUBTAPM 1	DS	X	A*3	CMS tape set mode attributes
6	PUBTAPM2	DS	X	A*4	DOS tape set mode attributes
7	PUBTAP7	DS	x	A *5	7-track indicator

PUBADR defines the fields of a physical unit block table as used in CMS/DOS. PUBADR is invoked by the PUBTAB macro.

6	PUBCSFLG	DS	X	A*5	Channel scheduler flags
7	PUBJCFLG	DS	X	A * 6	Job control flags
	PUBWIT	EQU	*-PUBADR		Length of PUB table
	PUBPTR	EQU	NEXTPUB		Pointer to original PUB

## PUBOWNER: PHYSICAL UNIT BLOCK OWNERSHIP TABLE

PUBOWNER is comprised of a 2-byte entry for each entry in the PUB table. For CMS/DOS, there are eighteen 2-byte entries. The address of the PUBOWNER table is at displacement  $x^{1}8^{1}$  of the system communication table (SYSCOM).

PUBOWNER DS OH PUB ownership table

ENTRY PUBOWNER DS 18X'000' PUB owner

PUBOWNER entries have the following meanings:

<u>B<b>y</b>te</u> 0	$\frac{\mathbf{v}}{\mathbf{x}} = \frac{\mathbf{u}}{\mathbf{v}} = \mathbf{v}$	$\underline{\texttt{Meaning}}$ The physical unit is reserved.
	X 4 40	CMS is waiting for the volume to be mounted.
1	X * 0 1 *	Background partition owns the physical unit.

### SSAVE: SYSTEM SAVE AREA

SSAVE is used by DMSITS to save the value of the SVC old PSW, the caller's registers, and other necessary control information required to process the SVC and return to the caller. Since SVC calls can be nested, several of these save areas can exist at one time. The system save area is allocated in protected free storage. SSAVE is invoked via the CMSAVE macro.

## SUBSECT: SUBSET WORK AREA

SUBSECT defines the fields in the SUBSET work area which is used by CMS SUBSET command processing and ABEND recovery.

The SUBSECT DSECT is pointed to by the ASUBSECT field (hex 634) in NUCON.

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning

## SVCSECT: SVC INTERRUPT STORAGE

SVCSECT describes the fields used by DMSITS in handling SVC interrupts. SVCSECT is built dynamically when an SVC is issued. The first SVCSECT is pointed to by the ASVCSECT field (hex 674) in NUCON; if SVCs are nested, the chain of SVCSECT blocks is processed using the CURRALOC and LASTALOC fields.

## SVEARA: LTA AND PP SAVE AREA DSECT

SVEARA describes the fields in a DOS/VS Logical Transient Area (LTA) or Problem Program (PP) save area. SVEARA is invoked via the DOSAVE macro. SVEARA is used by DOS/VS routines to save the value of the PSW and registers for purposes such as linkage to and from transient routines.

## TSOBLKS: TSO CONTROL BLOCKS

TSOBLKS contains OS control information used by CMS, that is, the command program parameters list (CPPL), user profile table (UPT), protected step control block (PSCB), and the environment control table (ECT).

The ATSOCPPL field (hex 5D8) in NUCON points to TSOBLKS.

## SECTION 3. RSCS DATA AREAS AND CONTROL BLOCKS

This section describes in detail each of the data areas used by RSCS. Unlike the CP and CMS format blocks in this publication, the RSCS format blocks are on fullword boundaries.

This section of the publication contains only DSECTs. Appendixes B and C contain other control areas used by RSCS.

### ASYNE: ASYNCHRONOUS EXIT ELEMENT

ASYNE defines symbolic addresses for elements on an asynchronous exit queue. An asynchronous exit queue element contains information by which a task requests that it handle asynchronous interrupts.

IOEXITQ, EXTQ, and ALERTQ in SVECTORS are the heads of three asynchronous exit queues. Each of these queues is comprised of supervisor elements defined by the ASYNE DSECT. IOEXITQ points to requests for I/O exits, EXTQ points to requests for external exit requests, and ALERTQ points to requests for ALERT exits.

0		ASYNNEXT	
4		ASYNTASK	
8		ASYNEXIT	
•			•
C I	ASYNCODE	ASYNSPAR	ASYNID

Hexadecimal Displacement	Field Name	Field Description, Contents, Meaning
0	ASYNNEXT DS 1F	Address of the next asynchronous interrupt exit request element
4	ASYNTASK DS 1F	Address of task element describing the task that requested the asynchronous interrupt
8	ASYNEXIT DS 1F	Address of the requested asynchronous exit routine
С	ASYNCODE DS AL2	Address of the device for which asyncronous I/O interrupts are requested or interrupt bit code
E	ASYNSPAR DS 1X	Reserved for IBM use
F	ASYNID DS 1X	1-byte ID of the task owning the asynchronous exit routine

#### BUFDSECT: SML TELECOMMUNICATIONS EUFFER

BUFDSECT is used to transmit buffer control information and buffer data to and from programmable remote stations.

The buffer sent across the TP line starts at BUFSTART; the first 7 bytes of BUFDSECT are used by the SML line driver but are not transmitted.

\$BUFFOOL in SML points to a queue of available TP buffers; \$INBUF in SML points to a queue of TP buffers that have been received from a remote station and are waiting to be deblocked. \$OUTBUF in SML points to a queue of TP buffers that are ready for transmission to remote stations.

0		BU FC HA IN	1

	BUFFAKE E	QU X'01'	Dummy buffer indicator
	BUFRESP E	QU X'02'	Response only in buffer
	BUFNAK E	QU X 04 P	NAK response being sent
	BUFTEXT E	QU X 108 1	Buffer contains text information
	BUFUCHEK E		Unit check expected
7	BUFSTART D	S CL2	Bisynch transmission control bytes
9	BUFBCB D	s 1C	Block control byte
A	BUFFCS D	S CL2	Function control sequence
С	BUFDATA D	S OF	Data portion of TP buffer

## COMDSECT

COMDSECT defines address constants used as pointers to subroutines common to all RSCS modules. These subroutines are contained in module DMTCOM. COMDSECT is pointed to by TCOM in SVECTORS.

0	GLINKREQ
4	GPAGEREQ
8	FPAGEREQ

15	DEVFLAGS DC	3X '00 '	Device status flags
18	DEVNAME DC	CL8 ·	EBCDIC device address and name

### FREEE: A FREE ELEMENT ON THE SUPERVISOR ELEMENT QUEUE

The FREEE DSECT defines an element in the chain of elements that comprise the free element queue.

FREEQ in SVECTORS points to the chain of free elements, each of which  $\,$  is defined by the FREEE DSECT.

Hexadecimal Displacement	Field Name		
0	FREENEXT	DS	1F
4	FREESPAR	DS	<b>CL11</b>
F	FREEID	DS	1 X

Field Description, Contents, Meaning
-----Address of next element in free queue
Spare field
Standard taskid offset
--ID=X\*00\*=> free element

### GIVEE: A GIVE ELEMENT

The GIVEE DSECT defines symbolic addresses for items used in processing a GIVE request.

 ${\tt GIVEQ}$  in  ${\tt SVECTORS}$  points to the queue of  ${\tt GIVE}$  elements used in task-to-task communications.

The GIVEADDR field of this DSECT is the address of a GIVE request table, which, in turn, contains addresses of buffers for elements describing requests and responses to requests. These tables are described below; the elements that fill the buffers are described in Appendix C: "RSCS Request Elements."

0	GI	VENEX	T			
4	ļ GI	VEADD	R			!
8	GI	VENAM	E			I
С	GIVESPAR		GIVENID	ı	GIVERID	   

Field Name	Field Description, Contents, Meaning
GIVENEXT DS 1F	Address of next GIVE element
GIVEADDR DS 1F	Address of GIVE request table in sending task's storage
GIVENAME DS CL4	Task name of receiving task
GIVESPAR DS AL2	Unused
GIVENID DS 1X	1-byte ID of receiving task after TAKE
GIVERID DS 1X	1-byte ID of sending task
	GIVENEXT DS 1F GIVEADDR DS 1F GIVENAME DS CL4 GIVESPAR DS AL2 GIVENID DS 1X

#### GIVE REQUEST TABLE

The format of a GIVE Request Table is:

0	synch lock
4	task name or A(GIVE Element)
8	A(GIVE Request Buffer)
С	A(GIVE Response Buffer)

When a task requests the services of another task via a GIVE request, the second field of the table above contains the task name of the task to which the task is to be sent. When DMTGIV builds a GIVE element for the request, it overlays this task name with the address of the GIVE element.

The task performing the requested service, builds a table called the TAKE request table, which corresponds to the GIVE request table.

#### TAKE REQUEST TABLE

The format of a TAKE request table is:

0	Task name	of GIVE requestor
4	A (TAKE	Request Buffer)
8	A (TAKE	Response Buffer)

### IOE: AN IZO ELEMENT

The IOE DSECT defines symbolic addresses of elements and other information associated with an I/O operation requested by a task.

 $\begin{tabular}{ll} \begin{tabular}{ll} \beg$ 

The field IOTABLEA points to the address of an I/O table defined by DSECT IOTABLE, which is described in this section.

0	<del> </del>		ION	EXT	
4			IOS	UBQ	
8			IOT	ABLEA

	SENSING	EQU X 80	Flag set to 1 while automatic sense is active
	CHANDONE	EQU X 40 4	Flag set to 1 when subchannel terminates
C	IOADDR	DS AL2	Address (cuu) of the device requesting current I/O operation
E	IOSBCHAN	DS 1X	Subchannel address; 1-byte; assigned by MSUP
<b>F</b> .	IOID	DS 1X	ID of task associated with this I/O operation; 1-byte; assigned by MSUP

### IOTABLE: AN IZO TABLE

The IOTABLE DSECT defines symbolic addresses for items used in processing an I/O interrupt request. The first five fields are filled in by the task to convey information about the I/O request to the supervisor. The last three fields are filled in by the supervisor to convey status information about the I/O operation to the task.

0				IOSYNCH	 	
4	DEVCUU		1	SENSREQ	 DEVCODE	 
8				PROGADDR	 	   
С	SIOCOND	   				
į				ENDCSW		
14				ENDSENSE		

Hexadecimal Displacement	Field Name			Field Description, Contents, Meaning
0	IOSYNCH	DS	1F	Synchronization lock for I/O operation
4	DEVCUU		AL2	Address (cuu) of device associated with this I/O operation
6	SENSREQ	DS	AL1	Number of sense bytes requested on unit check
7	DEACODE	DS	AL1	1-byte VM/370 device type code (not used by I/O manager)
8	PROGADDR	DS	1F	Address of channel program for the I/O operation
	SIOCOND	EQU	*	1-byte SIO condition code return information
С	ENDCSW	DS	2F	Ending CSW with composite status return information
14	ENDSENSE	DS	AL1	Requested return sense information on unit check CSW status
	TYPPUN TYPPRT	_	X * 80 * X * 40 *	VM/370 type code for the punch VM/370 type code for the printer
		- 20		in, s. v of Fo cours and Franco.

#### LINKTABL DSECT

The LINKTABL DSECT describes the status of a single link in the RSCS network; collectively, all the links defined for the system are referred to as the link table.

0	LINKID					
4						
8		LDEFTNM	E			
С		LACTINM	 E			
10	LDEFDRVR					
14						
18	LACTDRVR					
1C						
20	LDEFLINE		LAC	TLIN	E	
24	LDRVRVAR					
28	LACTCLS1   LACTCL:	S2	LACTCLS3	I	LACTCLS4	
30	LTIMEZON   LFLAG	 	LRES	ERVD		
34	LPENDING	I	LTA	KEN		
38	LPOINTER					
3C	LMSGQ					
40	LTRNSCNT		LER	RCNT		
44	LTOCNT		L	SPAR	E	
48	LNKCLOCK					
4C						
1	L					

An 8-byte header precedes the first entry in the link table (that is, the first link defined by the LINKTABL DSECT). The TLINKS field in SVECTORS points to this header, which has the following format:

0			4	6		
ľ	Total	links	   max		current	
l			<u> </u>	<u> </u>	links	

#### where:

total links is the total number of links defined for an RSCS installation via the GENLINK macro during system generation. (For information on the GENLINK macro, see the  $\underline{\text{VM}}/\underline{370}$ :  $\underline{\text{System Programmer's Guide}}$ .)

max links is the maximum number of concurrently active links allowable.

current links is the number of links active in RSCS at a given time.

### LINKTAEL

Hexadecimal	Field			
Displacement	Name			Field Description, Contents, Meaning
0	LINKID	DS	CT8	EBCDIC linkid
8	LDEFTNME		CL4	Default task name
С	LACTINME			Active task name
10	LDEFDRVR		CT8	Default driver id
18	LACTDRVR		CT8	Active driver id
20	LDEFLINE		2 X	Default virtual line address
22	LACTLINE		2 X	Active virtual line address
24	LDRVRVAR		1 F	Line driver variable information
28	LDEFCLS1			Default spool file CLS 1
29	LDEFCLS2	DS	CL1	Default spool file CLS 2
2 A	LDEFCLS3	DS		Default spool file CLS 3

	LALERT		X 4 4 0 4	AXS ALERT exit set
	THOLD			Link hold set
	LDRAIN			Link drain in progress
	LTRALL			Link transaction tracing (all)
	LTRERR		X • 04 •	Link transaction tracing (error)
	LHALT	EQU	X • 0 1 •	Link to be forced inactive
	LINKLEN	PΛ	U *-LINKTABL	Length of link table entry
32	LRESERVD	_	TH THE TRACE	Count of tag elements reserved
34	LPENDING			Count of unaccepted tags
36	LTAKEN	DS	1H	
38	LPOINTER		1F	Count of tag slots in use Address of start of the TAG queue for this
30	LPOINTER	בע	IF	RSCS link.
3C	LMSGQ	DS	1F	MSG queue pointer
40	LTRNSCNT	DS	1 H	Link transaction count
42	LERRCNT	DS	1H	Error count
44	LTOCNT	DS	1 H	Timeout count
46	LSPARE	DS	1H	Spare halfword
48	LNKCLOCK	DS	8 X	Clock comparator value for this link

### REQBLOCK: NPT REQUEST BLOCK

REQBLOCK defines data and  $\,$  information for a request for file processing  $\,$  by the NPT line driver.

The first four fields (hex 0-F) of this DSECT form a GIVE request table, which is described in "GIVEE: A GIVE Element", in this section.

The next seven fields (hex 10-23) of this DSECT for a GIVE request buffer in the format of a File Request Element, which is described in "Appendix C: RSCS Request Elements."

0	RDEVSYNC				
4	RDEVREQN				
8	RDEVREQ				
С	RDEVRESP				
10	RDEVRLEN   RDEVFUN   RDEVRESV   RDEVSOPT				
14	RDEVTAG				
18	RDEVFIOA				
1C	RDEVLINK				
24	RDEVNAME				
28	RDEVSTYL				
2C	RDEVFLAGS				

Hexadecimal Displacement		Field Description, Contents, Meaning  prise the NPT GIVE request table
0	RDEVSYNC DC F'0'	Synch lock
4	RDEVREON DC CL4 AXS	File access task
8	RDEVREQ DC A (0)	Request buffer address
С	RDEVRESP DC AL1(0), AL3(0)	Response buffer address
		mprise the NPT GIVE request buffer st element (as shown in Appendix C)
10	RDEVRLEN DC AL1(0)	Request length
11	RDEVFUN DC AL1(0)	Request function
12	RDEVRESV DC AL1(0)	Reserved byte
13	RDEVSOPT DC AL1(0)	Sub option byte
14	RDEVTAG DC A (0)	Tag address
18	RDEVFIOA DC A(O)	File I/O area address
1C	RDEVLINK DC CL8 •	Link name
24	RDEVNAME DC C'	Device name
27	RDEVSTYL DC C'	De vice style
2C	RDEVFLAGS DC AL1 (0,0,0,0)	Device flags

### SVECTORS: LOW STORAGE DEFINITIONS

The SVECTORS DSECT defines low storage for the RSCS virtual machine. It includes two types of storage: machine-defined and RSCS-defined.

## MACHINE-DEFINED LOW STORAGE

The SVECTORS machine-defined low storage defines machine status data referenced during program execution and required by System/370 architecture.

### RSCS-DEFINED LOW STORAGE

RSCS-defined low storage begins at hex location 200 and is defined specifically for the RSCS virtual machine. It contains pointers to modules that comprise the supervisor, to supervisor control queues, and to queues of requests for supervisor services.

## TAG: THE RSCS FILE DESCRIPTOR

The TAG DSECT describes a file enqueued for processing by RSCs. The data in this area is built from the TAG record associated with a file via the CP tag command and from the CP spool file block (SFB) that describes the file.

## **TAGAREA**

The TAGAREA DSECT contains tag queue pointers and other tag control information. It is pointed to by TTAGQ in SVECTORS.

	Field Name			Field Description, Contents, Meaning
0	TAGAFREE	DC	A (0)	Address of queue of free TAG slots (or elements)
4	TAGACIN	DC	A (0)	Pointer to queue of active input TAGs
8	TAGACOUT	DC	A (0)	Pointer to queue of active output TAGs
C E	TAGAGOT TAGAHOLD		H • O •	Number free slots left Number slots to be held

## TANKDSEC: SML UNIT RECORD TANK

TANKDSEC is used to reference buffer data and control information contained in tanks, which are unit buffers used to deblock the larger TP buffers. (TP buffers are defined by the needs of an individual remote station and their size varies from station to station.)

\$TANKPOL in SML points to a queue of available tanks.

0	TANKCHN	İ
4	TANKRCB   TANKSRCB   TANKCNT	l
8	TANKDATA	ļ
	•	
88		 

Hexadecimal Displacement			Field Description, Contents, Meaning

6	TANKCHT DS	1 H	Count of data bytes in tank
8	TANKDATA DS	CL132	Data area in tank
8C	TANKEND DS	0 <b>F</b>	Force next to word boundary

## TASKE: A TASK ELEMENT

The TASKE DSECT defines symbolic names of status information pertaining to an active task.

The TASKQ field of SVECTORS points to a queue of task elements, each of which is defined by this DSECT. The queue consists of one task element (TASKE) for each active task.

0	 		TASKNEXT			<sub>1</sub>
4	<del></del>		TASKSAVE

8	TASKNAME DS CL4	Task name specified by the task; 4 bytes
С	TASKSPAR DS AL2	Reserved for IBM use
E	TASKSTAT DS 1X	Status flags associated with the task
F	TASKID DS 1X	Number ID for the task; 1 byte is assigned by supervisor when task is made active
	Bits defined in TASKSTAT	
	WAITING EQU X'80'	Flag set to 1 when task is non-dispatchable
	LOCKLIST EQU X'40'	Flag set to 1 while task is waiting for the synch lock list
	LIMBO EQU X'01'	<pre>Flag set to 1 when a task is being   terminated</pre>

### TCTDSECT: SML TASK CONTROL TABLE

TCTDSECT defines the format of six tables in SML storage which you can find at labels \$CCOM1, \$WCOM1, \$PCOM1, \$RCOM1, \$UCOM1, and \$JCOM1. Each table corresponds to an SML input/output processor and is used by that processor to perform its I/O function.

The GIVE request table and the GIVE request buffer used by SML are embedded in the task control table at hex locations 24 through 30 and 34 through 40, respectively.

### TAREA: A TASK SAVE AREA

TAREA an area associated with each task. This area is used to save the contents of the task's PSW and general registers and to flag whether or not a task has information ready to pass.

TAREA comprises the first 78 bytes of the storage area defined in each task's storage.

The following appendixes supplement the information in this publication:

- "Appendix A: CP and RSCS Equate Symbols" contains assembler language equate symbols used in CP and RSCS to reference data.
- "Appendix B: RSCS Control Areas" contains areas containing constants and variables used during execution of RSCS tasks.
- "Appendix C: RSCS Request Elements" contains information on and formats of tables used during RSCS task-to-task communication.
- "Appendix D: CMS Equate Symbols" contains assembler language equate symbols used in CMS to reference data.
- "Appendix E: Data Areas and Control Blocks References" contains the names of CP, CMS, and RSCS control blocks. This appendix also contains information showing which modules reference the data areas or control blocks and, in some cases, gives information on how the data areas or control blocks are created and released.

## APPENDIX A: CP AND RSCS EQUATE SYMBOLS

This appendix contains assembler language equate symbols used to reference CP and RSCS data for:

- VM/370 Device Classes, Types, Models and Features
- VM/370 Machine Usage
- VM/370 Extended Control Registers
   VM/370 CP Usage
   VM/370 Registers

This appendix lists the control areas used during task processing. Information such as lists of synch locks, channel programs, TAKE request tables and buffers, and various work constants are included in these areas.

## AXS MONITOR CONTROL AREA

The AXS Monitor Control Area is a data area used by DMTAXS to set up synch locks, a TAKE request table, a TAKE request and response buffer, and an input buffer.

Field <u>Name</u> AXSNAME REXNAME	DC DC	OF'O',CL4'AXS' OF'O',CL4'REX'	Field Description, Contents, Meaning Task name for AXS routine Task name for control monitor
AXSLOCKS	DC DC DC	· - /	File tag arrival synch lock address Request arrival synch lock address Command synch lock address
ARRLOCK	DC	F • 0 •	File tag arrival synch lock
CMDLOCK	DC	F • 0 •	Command synch lock
AXSTAKE		OF'O' CL4'' AL1(L'AXSREQ) AL3(AXSREQ) A(AXSRESP)	TAKE request table Giver's task name Pointer to request buffer (input) Pointer to response buffer (output)
AXSREQ	חכ	XL140'00'	TAKE request buffer

CMDIN CMDINPGS	DC DC	CL122 * * X*00 *	Input buffer for command element Command in progress switch
AXSCSAVE	DC	18F'0'	Common routine save area

## REX MONITOR CONTROL AREA

The REX Monitor Control Area is a data area used by DMTREX to initialize the DMTAXS and DMTLAX modules, point to queues of system data (such as the link table chain and the chain of tag elements), set up a series of synch locks for REX processing function, set up a console element, read and write channel programs, a console table buffer, a message buffer, a TAKE request table, and buffer, and various work constants.

Field			
Name			Field Description, Contents, Meaning
REXREX	DC	OF'O',CL4'REX'	Task name

This appendix provides information on the format and use of RSCS request elements. These elements are used by RSCS tasks in task-to-task communication.

The information provided includes:

- The name of the module that builds the element.
- The function performed by the element.
- A brief description of the elements usage.
- The format of the element.
  Any operational notes that might be useful in understanding how the element is used.

## COMMAND ALERT ELEMENT FORMAT A1

BUILT BY:

DMTCMX

FUNCTION:

Execute an AXS command

DESCRIPTION:

This ALERT element is passed via ALERT to the AXS task (DMTAXS) to request

second-level processing of ORDER and PURGE commands.

0	Length   Functi (n-1)   Code:	on X'10',X'11'	Response   Code	
4		linkid		
C	spoolid count (n-X'E')/2	s	poolid	
10		       		
 	spoolid	l s	poolid	

#### OPERATIONAL NOTES

The linkid field specifies the affected link. The spoolid fields are binary halfwords and specify the files enqueued on the specified link which are to be re-ordered or purged. The spoolid count field is a binary halfword and specifies the total number of spoolid fields present. The meanings of the other fields follow.

#### ORDER Command

Function Code: X'10'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers:

X'80' Response messages go to local RSCS operator X'00' Response messages go to specified link.

#### PURGE Command

Function Code: X'11'

Response Codes:

X'00' Element accepted for processing X'10' Element rejected, busy

Modifiers:

X'80' Response messages go to local RSCS operator

X'40' Purge all files enqueued on the specified link
X'00' Purge only specified files, response messages go to specified link

## COMMAND ALERT ELEMENT FORMAT A2

BUILT BY: DMTCMX

FUNCTION: Execute AXS command

This ALERT element is passed via ALERT to the AXS task (DMTAXS) to request DESCRIPTION:

second-level processing of CHANGE commands.

0	Length (X'33')	1	Function Code: X'20'	1		sponse de	1	Modifiers
4			_					
			1	ink.	1d			
C	spoolid			1		priori	 t <b>y</b>	
10	HOLD	١	CLASS	1		COPY		
14								
			Dist	rib	ıti	ion Code		
1	 							
1C			file	na m		iletype		an am o
•	•		1116	HOLEN	<b>5/1</b>	. rre cype	, u.	311 dill 6
i	L							

#### OPERATIONAL NOTES

The linkid field specifies the link on which the object inactive file is enqueued. The spoolid field is a binary halfword and specifies the object file's VM/370 RSCS identifier.

The following fields are specified only when the corresponding file attribute is to be changed. If the field is not specified, it is set to all 1 bits (X'FF...').

- Priority halfword binary priority 0-99
- HOLD X'7F' set hold status
  - X'3F' reset hold status (NOHOLD)
- CLASS 1-byte EBCDIC class, A-Z, 0-9
- COPY halfword binary copy count, 1-99
  Distribution code 8-byte EBCDIC spool file distribution code
- filename/filetype, dsname 24-byte EBCDIC spool file filename or filetype or dsname

## CHANGE Command

Function Code: X'20'

Response Codes:
 X'00' Element accepted for processing
 X'10' Element rejected, busy

Modifiers:

X'80' Response messages go to local RSCS operator X'00' Response messages go to specified link

### COMMAND ALERT ELEMENT FORMAT LO

BUILT BY:

DMTCMX

FUNCTION:

Execute a line driver command

DESCRIPTION:

This ALERT element is passed via ALERT to a line driver task (DMTNPT, DMTSML) to request second-level processing of START, DRAIN, FREE, HOLD, and

TRACE commands.

0	Length	Function   Code: X'80,X'81,   X'82',X'83',X'84'	     Modifiers
4			 · · · · · · · · · · · · · · · · · · ·
	 	locid	l I
	•	20014	i
			ļ

#### OPERATIONAL NOTES

The locid specifies the location which is to receive response messages. The meaning of the other fields follow.

### START Command

Function Code: X'80'

Response Codes:

X'00' Element accepted for processing
X'10' Element rejected, busy

Modifiers:

X'80' Start updated classes X'00' Reset DRAIN status

### DRAIN Command

Function Code: X'81'

Response Codes:

X'00' Element accepted for processing

X'10' Blement rejected, busy

Modifiers: Unused

#### FREE Command

Function Code: X'82'

284 IBM VM/370: Data Areas and Control Block Logic

#### Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers: Unused

## HOLD Command

Function Code: X'84'

Response Codes:
 X'00' Element accepted for processing
 X'10' Element rejected, busy

Modifiers:

X'80' HOLD Immediate

X'00' HOLD after file processing

### TRACE Command

Function Code: X'84'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers: X°C0° TRACE end

X'80' TRACE errors

X'00' TRACE all

#### COMMAND ALERT ELEMENT FORMAT L1

BUILT BY:

DMTCMX

FUNCTION:

Execute a line driver command

DESCRIPTION: This ALERT element is passed via ALERT to a line driver task (DMTNPT, DMTSML) to request second-level processing of BACKSPAC and FWDSPACE

commands.

0	Length   Function (X'OF')   Code: X'90',X'91'	Response     Code   Modifi	ers
4			
!	locid		
C	Count		

#### OPERATIONAL NCTES

The locid specifies the location which is to receive response messages. The count field is a binary fullword, and specifies the number of units to be backspaced or forwardspaced. The meanings of the other fields follow.

#### BACKSPAC Command

Function Code: X'90'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers:

X 1 8 0 1 Backspace count

X'00' Backspace file (restart)

### FWDSPACE Command

Function Code: X'91'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers: Unused

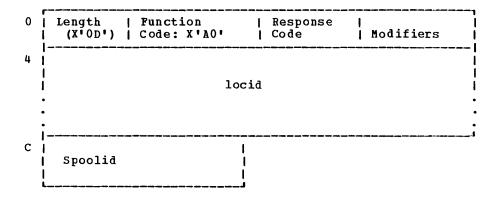

#### COMMAND ALERT ELEMENT FORMAT L2

BUILT BY: DMTCMX

FUNCTION: Execute a line driver command

DESCRIPTION: This ALERT element is passed via ALERT to a line driver task (DMINPI,

DMTSML) to request second-level processing of FLUSH commands.

#### OPERATIONAL NOTES

The locid specifies the location which is to receive response messages. The spoolid field is a binary halfword, and specifies the VM/370 RSCS identifier of the active file to be flushed. The meanings of the fields follow.

#### FLUSH Command

Function Code: X'A0'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers:

X'80' Flush all copies, purge file

X'40' Flush hold, keep file, do not decrement copy count

X'00' Flush, decrement copy count, purge file if no copy count remains

#### COMMAND ALERT ELEMENT FORMAT L3 (ALSO MESSAGE ALERT ELEMENT)

BUILT BY: DMTCMX, DMTMGX

FUNCTION: Execute a line driver command

DESCRIPTION: This ALERT element is passed via ALERT to a line driver task (DMINPT,

DMTSML) to forward messages, and to request second-level processing of CMD

commands.

0	Length (n-1)	Function   Response     Code: X'B0',X'B1'   Code   Modifiers
4	<del></del>	
	l 1	locid
•	•	
•		
C	<del></del>	_
	•	Message/Command Text
	• !	

#### OPERATIONAL NOTES

The locid specifies the location which is to receive the message or command text. The meanings of the other fields are listed below.

#### CMD Command

Function Code: X'BO'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers: Unused

#### MSG Command

Function Code: X'B1'

Response Codes:

X'00' Element accepted for processing

X'10' Element rejected, busy

Modifiers: One-byte binary RSCS severity code

# COMMAND REQUEST ELEMENT

BUILT BY: DMTNPT, DMTSML

FUNCTION: Execute an RSCS operator command

DESCRIPTION: This request element is passed by a line driver via GIVE/TAKE to the REX

task in response to a command entry at a remote station.

## OPERATIONAL NOTES

No response text is returned. Command responses are distributed via DMTMGX.

## FILE REQUEST ELEMENT

BUILT BY: DMTNPT, DMTSML

FUNCTION: Initiates or terminates processing of an input or output file.

DESCRIPTION: This request element is passed via GIVE/TAKE to the AXS task by line drivers to effect local spool file access during communications with a

remote station.

0	Length   Function Code:   Unused   Modifiers (X'13')   X'01', X'02',
4	TAG Address
8     	I/O Area Address
C I	linkid

# OPERATIONAL NOTES

The use and meaning of the various field depends on the requested function, as described below. Certain fields may be updated during request processing. The (updated) file request element is returned to the requestor as a GIVE response.

## Open Input

Function Code: X'01'

Modifiers: Unused

Tag Address: Response field which points to the opened file's active TAG in DMTSYS

I/O Area Address: Response field which points to a virtual page buffer containing the opened file's first VM/370 spool data buffer.

linkid: Request field which specifies the requesting line driver's linkid.

Response Post Codes:

X'08' Terminal system error

X'04' No file available

X'02' Undefined linkid

X'01' Previously open file returned

## Open Output

Function Code: X'11'

Modifiers: X'80' Do not return possible previously opened file

Tag Address: Request field which points to a prototype file TAG for the output file, constructed by the calling line driver.

I/O Area Address: Response field which points to a virtual page buffer containing an I/O table, a write CCW, and a buffer for processing the output file.

linkid: Request field which specifies the requesting line driver's linkid.

Response Post Codes:

X'04' Error, file not opened

X'02' Undefined linkid

X'01' Previously open file returned

## Close Input

Function Code: X'02'

Modifiers:

X'80' Do not purge copy or file

X'40' Purge all copies, and purge file

Tag Address: Request field which points to the file's active TAG in DMISYS, as supplied by open input.

I/O Area Address: Unused

linkid: Unused

Response Post Codes: X'04' TAG not found, close failed

## Close Output

Function Code: X'12'

Modifiers: Unused

Tag Address: Request field which points to a prototype file TAG for the output file, constructed by the calling line driver. This TAG is used to update the parameters to be set for the output file.

I/O Area Address: Request field which points to the file's I/O area, as supplied by open output.

linkid: Unused

Response Post Codes:

X'04' I/O area not found, close failed

## LINE ALERT ELEMENT

BUILT BY: DMTCMX

FUNCTION: Request line port allocation

DESCRIPTION: This ALERT element is passed via ALERT to the LAX task (DMTLAX) to verify and reserve line ports for links being activated in response to a START

command.

0	Length   Function   (X'0F')   Code: X'01'		Unused
4 (	Line Address	   	Unused
8	 li	nkid	

## OPERATIONAL NOTES

The use and meaning of the fields are described below. Certain fields are updated during processing.

## Response Codes:

X'08' Specified line address not attached (CC=3)

X'04' Specified line address not BSC port device type

X'02' Line not available

Line Address: Request field specifying requested line address. Zero specification implies request for allocation of a switchable line from the port table. If successful, the port's line address is returned in this field as a response.

linkid: Response field specifying the ID of the link which has reserved the particular requested line address (with response code X'02').

# MESSAGE REQUEST ELEMENT

BUILT BY: DMTREX, DMTCMX, DMTAXS, DMTNPT, DMTSML

FUNCTION: Issue an RSCS message

DESCRIPTION: This request element is passed via GIVE/TAKE to the REX task, to specify

the construction and distribution of an RSCS message (by DMTMGX).

0	Length   Function   Routing   Severity (n-1)   Code: X'02'   Code   Code									
4   	Receiver locid									
C I	Receiver userid									
14	Issuing Module Code   Action   Code									
18	Binary Message Number   Unused									
1C	8-byte Variable Substitution Values for Message Text									

## OPERATIONAL NCTES

The routing code and severity code from the message definition (in DMTMSG) are used when not supplied in the message request element. If the message is not defined in DMTMSG, it is constructed using the specifications in the message request element, and the "variable substitution values" become the message text, unmodified.

Routing codes: X'80' Local RSCS console

X'40' Remote addressee

X'20' Local user X'10' Local VM/370 operator

No response text is returned.

# PORT TABLE

BUILT BY: Assembly of DMTSYS at RSCS generation

FUNCTION: Record allocation status of switchable line ports available to RSCS

DESCRIPTION: The first doubleword of the table is reserved for control information. Each following halfword contains the virtual device address of a line port

which may be dialed, and which is available to RSCS.

0	Number of Line Port Entries in Table
4	
8	Virtual Line Address   Virtual Line Address
C	Virtual Line Address   Virtual Line Address
10	!
•	•
i	Virtual Line Address   Virtual Line Address

# OPERATIONAL NOTES

The line port entries are marked "in use" by setting the high-order four bits of the entries to 1's.

## TERMINATE REQUEST ELEMENT

BUILT BY: DMTNPT, DMTSML

FUNCTION: Terminate line driver task

This request element is passed via GIVE/TAKE to the REX task, to terminate line driver operation in response to a DRAIN command. DESCRIPTION:

	Γ			* ** ** ** * * * * * * * * * * * * * *	7
0	1	Lenath	1	Function	1
-	:			·	:
	1	(1)	- 1	Code: X'03'	ı
	L				

# OPERATIONAL NOTES

There are no error conditions for the terminate function, so no response is made. However, line driver tasks must issue a WAIT request following a call to GIVE for terminate, because REX may not execute the request immediately.

This appendix contains assembler language equate symbols used in CMS to reference data

# APPENDIX E: DATA AREAS AND CONTROL BLOCKS REFERENCES

This appendix contains lists of CP, CMS, and RSCS control blocks. The lists contain information showing which modules reference the data areas or control blocks and, in some cases, information on how the data areas or control blocks are created and released.

## CP CONTROL BLOCKS REFERENCES
